Abstract

Catfish belong to the order Siluriformes. They are one of the largest orders of teleost fish, with over 5,000 living species, accounting for approximately 15% of teleost fish species, or 7.8% of all vertebrates. Catfish are important commercial aquaculture species in many countries. Particularly, channel catfish (*Ictalurus punctatus*) is the leading aquaculture species in the United States, accounting for over 60% of all U.S. aquaculture production, and representing a two-billion-dollar industry in the United States. With the purpose of enhancing the quality and quantity of catfish production, genetic and breeding programs have been established. Selective breeding, and genetic enhancement programs such as strain evaluation, selection, intraspecific crossbreeding and interspecific hybridization have been utilized to improve various traits of catfish to enhance the quality and quantity of catfish production.

Major genomic resources have been developed in catfish. These resources included ESTs, RNA-Seq datasets, various molecular markers, genetic linkage maps, physical maps, and BAC end sequences. These genomic resources supported the effort to generate the whole genome reference sequence, and could be utilized for genetic enhancement programs and functional studies. Recently, the channel catfish genome was sequenced from a double haploid template with coverage over 60X (unpublished data), and a total of 29,704 genes were predicted and annotated in catfish genome.

Accuracy, completeness, contiguity and connectivity are four parameters most often used for the evaluation of whole genome assemblies. Accuracy refers to the percentage of correct base calling. Completeness refers to the percentage of the genome sequences being assembled. Contiguity refers to the length of contigs. Connectivity refers to scaffolding of contigs in the chromosome level.

Draft genome sequences of related catfish species, ictalurid catfish (channel catfish and blue catfish), common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*) were generated and compared to assess the completeness of the channel catfish genome sequences. The two selected catfish species, common plecostomus and striped Raphael catfish, harbor scute-type scales while the channel catfish and blue catfish (*Ictalurus furcatus*) are both scaleless. Through comparative genome analysis, especially through comparison of their genes, insights into the possible genes or gene pathways involved in the scale formation were inferred.

A total of 565.11 million and 326.33 million 100 bp paired-end reads were obtained through Illumina HiSeq2000 platform for common plecostomus and striped Raphael catfish, respectively. Genome size of two armored catfish species was predicted as 1.1 Gb for common plecostomus and 0.8 Gb for striped Raphael catfish. ABySS assembler was applied to provide a high quality *de novo* assembly. In common plecostomus genome, a total of 472,063 contigs were assembled with N50 contig size of 4,151 bp, and average contig size of 2,156 bp. Similarly, in striped Raphael catfish genome, a total 381,982 contigs were assembled, with a N50 of 4,413 bp, and average contig size of 2,086 bp. After the annotation, a total of 28,122 and 26,190 unique genes were obtained for common plecostomus and striped Raphael catfish, respectively.

Twelve fish genomes were used for comparative genome analysis of their gene contents. These included zebrafish (*Danio rerio*), Atlantic cod (*Gadus morhua*), medaka (*Oryzias latipes*), tilapia (*Oreochromis niloticus*), fugu (*Takifugu rubripes*), cave fish (*Astyanax mexicanus*), stickleback (*Gasterosteus aculeatus*), spotted gar (*Lepisosteus oculatus*), coelacanth (*Latimeria chalumnae*), platyfish (*Xiphophorus maculatus*), tetraodon (*Tetraodon nigroviridis*), and ictalurid catfish. Genes from these species were compared with those of zebrafish, a species with relatively complete genome sequences. The number of genes that were identified from the zebrafish genome but not from the genome of other species varied from 780 (channel catfish) to 2,594 (fugu). Compared with the ictalurid catfish genome, the zebrafish genome ‘missed’ the smallest number of genes (987) followed by cave fish (1,537), spotted gar (1,559) and platyfish (1,853), and tilapia (1,882). Such comparative genome analysis could indicate that the ictalurid catfish genome sequences is as complete as the zebrafish genome, and better than other ten fish genomes.

After filtering through all ictalurid catfish genomic resources and conducting a reverse blast search, a total of 167 genes were identified as armored catfish-specific genes. Among these, 93 genes were found from common plecostomus genome assembly, while 91 genes were found from striped Raphael catfish genome and 17 genes were overlap in both databases. Of these 167 genes, 11 gene functions can be searched based on their identities.

Conserved syntenic analysis was applied to determine whether any armored catfish-specific genes were absent in the ictalurid catfish genome. As a result, of the 167 armored catfish-specific genes, there are 22 genes were found in a highly conserved syntenic block, suggesting that they might be truly missing from the catfish genome. Of these 22 genes, interphotoreceptor matrix proteoglycan 1, osteocrin-like, and protein pitchfork were annotated as functional genes. The osteocrin gene was reported to modulate osteoblastic differentiation, while pitchfork protein is

highly related to Shh signaling pathway, thus these two genes may play important role in scale formation.

In conclusion, ictalurid catfish genome is more complete than other fish species, and close to the completeness of zebrafish genome. Through the comparative genome analysis, a total of 167 armored catfish specified genes were identified in this dissertation. Conserved syntenic analyses indicated that 22 genes were present in zebrafish or other genomes but were absent from the channel catfish conserved syntenic blocks, providing stronger evidence that they might be truly missing from the catfish genome, but additional analyses are required to confirm this. This study is the first comparative genomics study among catfish species. It will supplement catfish genomic resources for researchers and provide a comparative genome analysis model for evolutionary studies.

Acknowledgments

First and foremost, I would like to express my deep and sincere gratitude to my advisor Dr. Zhanjiang Liu for his constant guidance, support, patience and encouragement throughout my Ph.D. program. Without him, it would be impossible for me to finish this dissertation. His mentorship has been fundamental to my development as a scientist and will have a significant impact on my future career. I would like to express my sincere gratitude to my committee: Dr. Nannan Liu, Dr. Eric Peatman, Dr. Rex Dunham and my dissertation outside reader, Dr. Luxin Wang for their advice and critical reading of my dissertation. My sincere thanks go to Ludmilla Kaltenboeck and Huseyin Kucuktas for their technical assistance and all the colleagues in the laboratory for their help, collaboration, and friendship. Many thanks to Dr. Jonathan Armbruster for his help in obtaining armored catfish and his discussions on phylogenies of catfish. I would like to express my gratitude to the Chinese Scholarship Council for the financial support for my Ph.D. program. Finally, I would like to thank my wife June, my mother in law Zenhua Liu, my parents Jianli Hao and Li Zhang, my brother Qiuren Zhang and my little daughter Rebecca Zhang for their love and support.

I. INTRODUCTION

Catfish belong to the order of Siluriformes. They constitute one of the largest orders of teleost fish with over 5,000 living species (Sullivan et al., 2006; Eschmeyer and Fong, 2014), accounting for approximately 15% of teleost fish species (total of approximately 33,000 species), or 7.8% of all vertebrates (about 64,000 species).

Catfish are a diverse group characterized by features of prominent barbels. Because the barbels resemble a cat's whiskers, they are named catfish. Their geographical distribution is the Americas, Asia, Africa and Europe. Their sizes vary from very large such as the Mekong giant catfish (*Pangasianodon gigas*, found in Southeast Asia) to a tiny parasitic species such as candiru (*Vandellia cirrhosa*, found in Amazon Basin). The status of their scales also vary from scaleless to armour-plated scale types (Nelson, 1994; Maddison et al., 2007).

Catfish are of considerable commercial importance. Many catfish species are very important natural resources for commercial fisheries or sport fishing. For example, catfish (mostly channel catfish, blue catfish, bullhead catfish *Ameiurus spp.* and flathead catfish *Pylodictis olivaris*) are among the top three sport fishing species in the United States. Many catfish are important aquaculture species including ictalurid catfish, clarias catfish, and pangasius catfish. For example, ictalurid catfish is the most important aquaculture species in the United States, while clarias catfish and pangasius catfish is widely cultured in the Asia and Africa (Eschmeyer and Fong, 2014).

Channel catfish is the leading aquaculture species in the United States, accounting for around 1/3 of all U.S. aquaculture production, representing a two-billion-dollar industry in the United States. Selective breeding (Dunham and Smitherman, 1984; Dunham, 2006), and genetic enhancement programs such as strain evaluation (Sun, et al., 2014; Waldbieser and Wolters, 2007; Dunham and Masser, 2012), selection, intraspecific crossbreeding and interspecific hybridization have been utilized to improve various traits of catfish to enhance the quality and quantity of catfish production. The performance and production traits addressed include growth rates (Dunham and Smitherman, 1983; Hallerman et al., 1986), disease resistance (Dunham et al, 1994; Li et al., 2012; Sun et al., 2012), low oxygen tolerance (Geng et al., 2014; Dunham et al., 2014), feed conversion efficiency (Robinson and Li, 2010), carcass traits and processing yields (Argure et al., 2003), and various other traits (Liu et al., 2013; Eya et al., 2012).

Major genomic resources have been developed for catfish in recent years. These resources included ESTs, RNA-Seq datasets, various molecular markers, genetic linkage maps, physical maps, and BAC end sequences. These genomic resources supported the effort to generate the whole genome reference sequence, and could be utilized for genetic enhancement programs and functional studies (Liu, 2011b; Peatman, 2012).

Reference genome is a key genomics resource. However, for many years, production of the reference genome sequence for catfish has been limited by the insufficient genomic resources as well as by funding. Benefited by the advances of next generation sequencing technologies and drastic reduction in sequencing cost, sequencing the whole genome is now possible. Such progress allowed sequencing of the whole genome from many fish species. For instance, genomes of almost a dozen of fish species has been sequenced including those of zebrafish (Howe et al., 2013), fugu (Aparicio et al., 2002), tetraodon (Jaillon et al., 2004), medaka (Kasahara et al., 2007), stickleback

(Jones et al., 2012; Guo et al., 2013), rainbow trout (Berthelot et al., 2014), Atlantic cod (Star et al., 2011), half-smooth tongue sole (*Cynoglossus semilaevis*; Chen et al., 2014), and common carp (*Cyprinus carpio*; Xu et al., 2014).

Recently, the channel catfish genome was sequenced from a double haploid template by Liu and Waldbieser (unpublished data) with coverage over 60X. Coupled with other well-developed genomic resources, it was successfully assembled using MaSuRCA assembler and annotated by FGENESH and Augustus software. A total of 29,704 genes were predicted and annotated in the channel catfish genome. Meanwhile, blue catfish draft genome sequences (unpublished data) were generated using Illumina's Moleculo sequencing technology. Because of high gene identity shared among ictalurid catfish (for example, channel catfish and blue catfish share an average of 98.7% gene sequence identity), channel catfish and blue catfish genome were pooled together and used as reference genome of ictalurid catfish to conduct comparative genome analysis in this study. While production of the draft genome sequences is relatively easy, their validation can be difficult.

Four parameters are most often used for the assessment of whole genome assemblies. These include accuracy, completeness, contiguity, and connectivity. Accuracy refers to the percentage of correct base calling. It is determined by the use of sequencing technology. For instance, the Roche 454 pyrosequencing technology has relative low level of sequence accuracy because the technology is incapable of calling poly-nucleotide tract (i.e., three or more consecutive identical DNA bases) accurately (Quince et al., 2009; Gilles et al., 2011; Luo et al., 2012). Pacific Biosciences (PacBio) sequencing technologies has a calling error rate of ~15% (English, et al., 2012). However, Illumina sequencing technology has a high accuracy of approximately 99.2% (Bentley et al., 2008).

Completeness refers to the percentage of the genome sequences that are being assembled. While the next generation sequencing technologies are very efficient in generating sequences, the assembly of short shotgun sequences into contiguous sequences (contigs) can be a great challenge. In particular, in the presence of a large number of interspersed repetitive sequences, computer software cannot make unique assignments of repetitive sequences into contigs. As a result, the repetitive sequences may be left behind, leading to a fraction of the genome not being assembled into the reference genome sequence. Additionally, depending on the number and quality of the libraries used for sequencing, a fraction of the genome can be missing from being sequenced, and therefore, absent in the final assemblies, leading to incompleteness of the genome assembly.

Contiguity refers to the length of contigs. It is one of the most important parameters for evaluating the quality of genome assemblies. Generally, longer range of contiguity indicate a better genome assembly and a more complete coverage with the same level of sequencing accuracy. Statistics utilized to measure the contiguity of a genome assembly is generally the size of contigs as reflected by average contig size, or minimum of contig size that included 50% of the genome (N50), or N_x (N60, N80, N90, or N99). Among these, N50 length, which describes a kind of median of genome assembly contiguity, is commonly used in the assessment of most genome assemblies.

Connectivity refers to length of scaffolds. Scaffolds are constructed from a number of contigs in the chromosome level through using mate pairs of sequencing reads from “jumping” libraries (libraries constructed with long insert length). Generally, insert sizes of over 20 kb make a great contribution to the final size of contiguity and scaffold for genome assemblies (Ekblom and Wolf, 2014). The goal for scaffolding is to bring contigs together into long, but connected

sequences although gaps may still exist between the connected contigs. In the perfect situation, each chromosome is represented by a single scaffold.

With the channel catfish reference genome available, one obvious question is how good is the genome sequence assembly? Such a question is complex in that the quality assessment needs to be made in terms of sequence accuracy, completeness, contiguity, and connectivity. Additionally, the correctness of the sequence assembly itself requires validation. Several of these parameters can be measured directly from the sequence assembly parameters. For example, the accuracy can be calculated from the sequences themselves and in this case, the Illumina sequences generated for the catfish genome had an error rate of ~0.8% (Waldbieser, personal communications). The contiguity is reflected in the sequence assembly contig sizes and its N50, N60, N80, N90, and N99. These parameters should provide a very comprehensive picture of the contiguity. Connectivity is reflected in the scaffolding into chromosome level sequences. For instance, the channel catfish genome had a total of 21,181 scaffolds, i.e., on average, each chromosome is represented by 365 scaffolds. However, the completeness is much more difficult to assess because the accurate genome size of channel catfish is not known, although it was estimated to be 0.95 Gb (Tiersch and Goudie, 1993).

The objective of this study was to generate and compare draft genome sequences of related catfish species, ictalurid catfish (channel catfish and blue catfish), common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*), and to assess the completeness of the ictalurid catfish genome sequences. The two catfish species, common plecostomus and striped Raphael catfish, harbor scute-type scales while the channel catfish and blue catfish, *I. furcatus*, are both scaleless. Though there are several possibilities leading to scale loss in ictalurid catfish, such as exons frame shift, promoter mutation, mutations in regulators of

scale related pathways, epigenetic implications, etc., my dissertation focuses on one of the possibilities, the scale related genes lost during evolution process. Through comparative genome analysis, especially through comparison of their genes contents, insights into the possible genes or gene pathways involved in the scale formation could be inferred.

II. LITERATURE REVIEW

Fish, catfish, channel catfish and armored catfish

Generally, fish can be defined as a group of craniate animals living in the aquatic environment and breathing with gills. They constitute such a diverse group that contain around 33,000 species, accounting for about 50% of the vertebrates (about 64,000 species). As shown in Figure 1, fish species can be divided into four major groups, including Myxini (hagfish), the Cephalaspidomorphi (lampreys), Chondrichthyes (cartilaginous fish, such as sharks), and Osteichthyes (bony fish). Among these, hagfish and lampreys are jaw-less fish (Agnatha). Osteichthyes class contain subclass Sarcopterygii (lobe-finned fish), and Actinopterygii (ray-finned fish) that include teleost fish. Most of the fish species belong to the class of Actinopterygii (ray-finned fish), accounting for over 95% of the 33,000 fish species.

Figure 1. Phylogeny of major classes in Chordata Phylum.

Catfish belong to the order of Siluriformes, class of Actinopterygii, phylum of chordate, and Animalia Kingdom. It is an extremely diverse clade with over 5,000 valid living species (Sullivan et al., 2006; Eschmeyer and Fong, 2014). By far, there are about 36 families found in Siluriformes order (Figure 2a and Figure 2b). Most catfish are found in tropical South America, North America, Africa, and Asia, and more than half of all catfish species live in America. Catfish lives in freshwater environments and most of them inhabit shallow, running water (Brutori, 1996).

Catfish is the predominant aquaculture species in the United States. The catfish industry produces over 130 million kilogram each year and provides downstream employment opportunities for tens of thousands of producers, processors, service providers, marketers, retailers and restaurant owners.

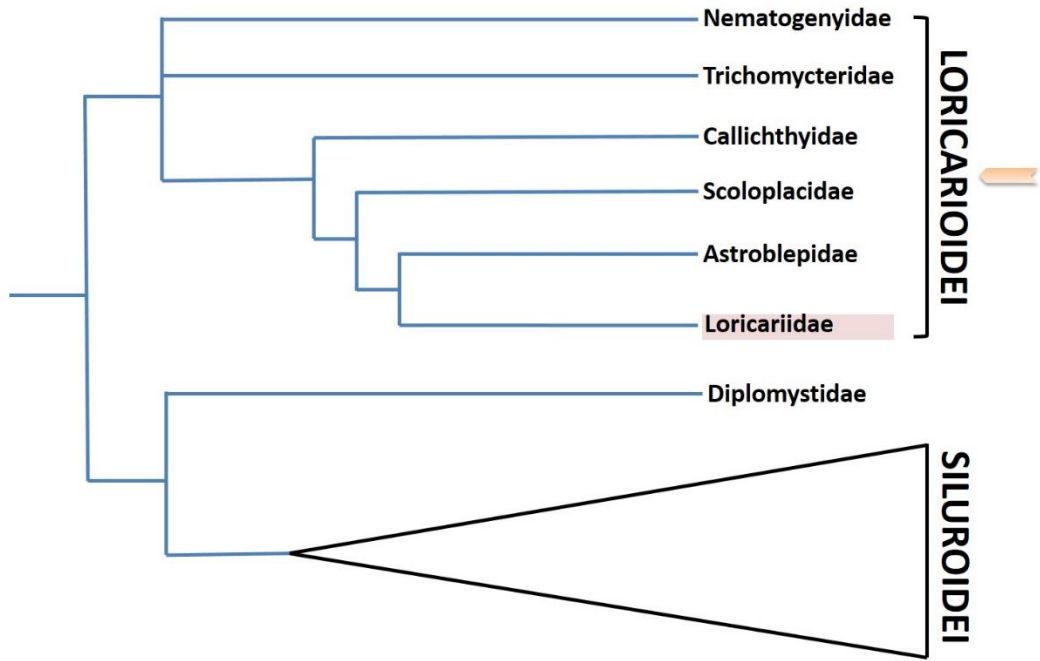

Figure 2a. Phylogeny of Class Siluriforme. Symbol ‘’ indicate armored catfish families (derived from Sullivan et al., 2006). Purple color shadowed are families where Common plecostomus belong to.

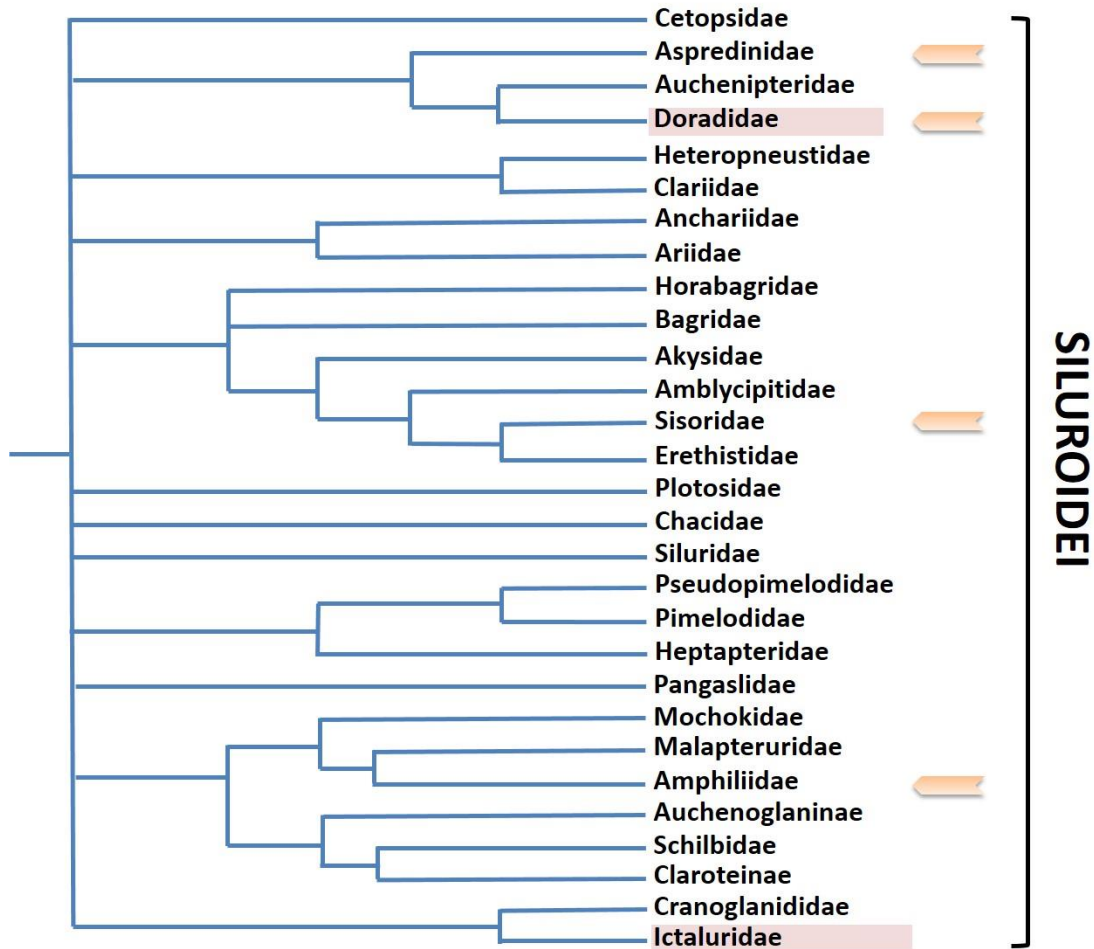

Figure 2b. Phylogeny of Order Siluriforme. Symbol ‘’ indicate armored catfish families (derived from Sullivan et al., 2006). Purple color shadowed are families where striped Raphael catfish and channel catfish belong to.

Channel catfish (*Ictalurus punctatus*) belong to the family Ictaluridae, Order Siluriformes. Channel catfish were originally found in Gulf States and Mississippi Valley north to the South Canada and Mexico (Wellborn, 1988). Nowadays, channel catfish are widely cultured in America, Europe and Asia, they primary distribute in Northern and Eastern of the America, including Alabama, Missouri, Nebraska, Kansas, Iowa and Tennessee. Channel catfish spend most of their lives at the bottom of rivers, reservoirs, natural lakes and ponds.

Channel catfish possess four pairs of barbel surrounding the mouth, with two pairs under the jaw, one pair on each side of mouth and one pair on each tip of the upper jaw. Channel catfish are sensitive to taste, because taste buds are widely distributed over the entire surface of its body, especially concentrated on barbels, gill arches and inside of mouth. Generally, channel catfish become sexually mature at 3-4 years of age, and the maximum size they can reach is around 18-23 kilogram. Channel catfish are scaleless. They have thick mucosal surface covering on their cylindrical bodies, which not only serves as a physical barrier for nutrient absorption and waste secretion, but also play important roles in mediating immune response (Li et al., 2012).

Channel catfish are able to adapt to a wide range of environmental conditions. Though the optimum water temperature for growth of catfish is around 29.4 °C, they can survive at a wide range of temperatures from just above freezing to nearly 38 °C. The optimum spawning temperature for channel catfish is around 27 °C (Wellborn, 1988). Adult channel catfish are able to tolerate salinities from near 0 to 11 ppt (parts per thousand), although salinities less than 4 ppt are preferred and the lethal oxygen level for catfish is about 1.0 ppt (Wellborn, 1988).

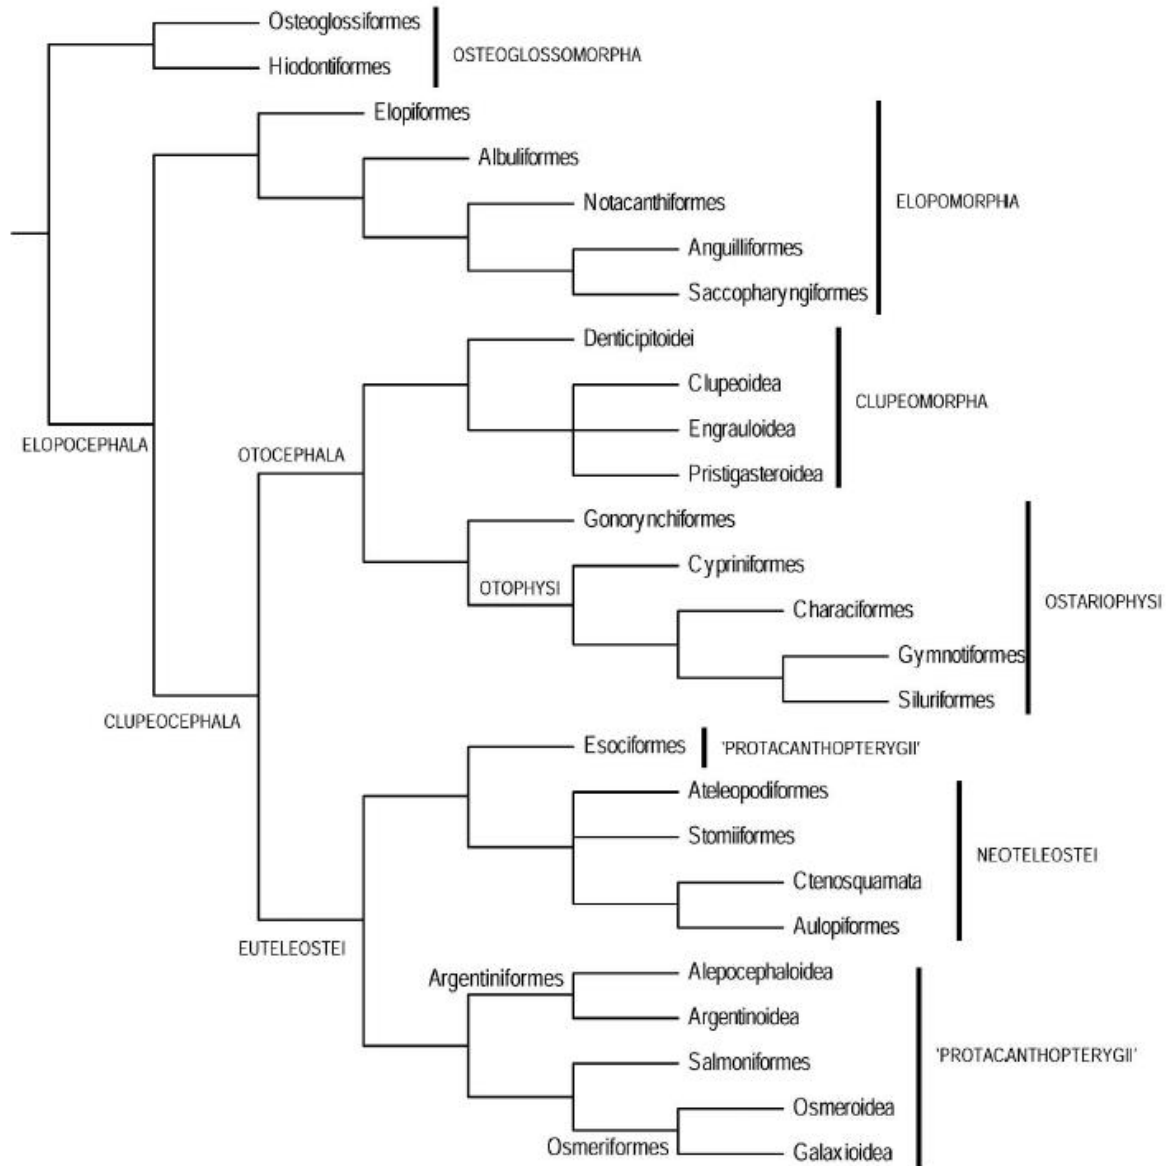

Figure 3. Phylogeny of major teleostean groups (Diogo et al., 2008).

As shown in Figure 3, as sister group to the orders Siluriformes and Gymnotiformes, Characiformes somewhat resemble their relatives of the order Cypriniformes. Their bodies are always covered well defined scales. This indicates vast majority of catfish species would rather lose their scales than gain scales during evolution process.

Even though vast majority of catfish species are scaleless, there are lineages of armored catfish harbor remnants of scale-like structure, which is called scutes. This bony armor structure

is formed by longitudinal series of dermal plates (Ostariophysi et al., 2004). As shown in Figure 2a and Figure 2b, the largest group of armored catfish is the superfamily Loricarioidea, which includes families Callichthyidae, Nematogenyidae, Trichomycteridae, Scoloplacidae, Astroblepidae, and Loricariidae. Among these, Loricariidae is the largest family, with six subfamilies, 92 genera, and more than 684 species (Microcosm Aquarium Explorer: <http://en.microcosmaquariumexplorer.com/wiki/Loricariidae>). In addition to Loricariidae, catfish species in Amphiliidae, Doradidae, Aspridinidae and Sisoridae families also harbor scutes.

In this study, two armored catfish common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*) were selected as the representatives to conduct comparative gene contents analysis with ictalurid catfish. Common plecostomus (Figure 4), also called suckermouth catfish, is a tropical fish belonging to Loricariidae family. As one of armored catfish species, they bear armor-like longitudinal rows of scutes that cover upper parts of the head and body. Common plecostomus natively located in South America, including Brazil, Guyana, Trinidad and Tobago, and Suriname. In past years, common plecostomus has been widely introduced into a number of countries around the world. In their natural habitat, Common Plecostomus feeds on algae, aquatic weeds and other plant matter and small crustaceans. Their sucker-like mouth allow them to adhere to a surface and rasp at food. In addition, this species is characteristic of having stomachs serving as accessory respiratory organ to conduct air-breathing as dissolved oxygen is low in water (Podkowa and Goniakowska-Witalińska, 2003).

Striped Raphael catfish (Figure 4), *Platydoras armatulus*, also called talking catfish or thorny catfish, belongs to the family Doradidae. Similar to common plecostomus, striped Raphael catfish is one type of popular aquarium fish. They are very pretty catfish with black and white stripes run through the body. Generally, they live on the soft water bottom and feed on mollusks,

crustaceans, and the remains of fish body (Sabaj and Ferraris, 2003). As one kind of armored catfish, they have thorny scutes distribute along the lateral line.

Figure 4. Pictures of *Hypostomus plecostomus* (left picture) and *Platydoras armatulus* (right picture). (Pictures came from website http://www.seriouslyfish.com/wp-content/uploads/2012/03/hypostomus_plecostomoides_1.jpg and <https://encrypted-tbn3.gstatic.com/images?q=tbn:ANd9GcTVExJqiROt8ckcya4Bifdx1HCLAnDgSkq9NzWeAERgDSaGZKevRSgsUIA>).

Fish scales

Most bony fish and cartilaginous fish own scales. Though the morphology of scales is diverse in shape and structure, they are all primarily composed of calcium. Scales function as physical barrier to protect fish body and impose restriction on body movement. Generally, the heavier and thicker scales are, the more protection they provide and more restriction on movement.

Scales evolved in an evolutionary order. Lower vertebrate, such as hagfish and lamprey do not have scales. In cartilaginous fish, such as sharks, they have teeth-like ‘placoid’ scales. This type of scale is made of bone and composed of three layers from outside to inside: enamel, dentine and central pulp. Different from normal scales which are derived from dermis layer and covered by epidermis layer, placoid scales pass through the epidermis layer, and have a definite size instead

of enlarging along with the growth of fish. New scales will grow and fill up the space opened during fish growth. Coelacanth (*Latimeria chalumnae*) scales are named 'cosmoid'. They are constituted of four layers: dense bone layer, spongy bone layer, dentine layer and enamel layer. While in bony fishes, two primary types of scales are found, they are named as 'ganoid' and 'elasmoid'. Both types of scales are composed of a calcified layer and a fibrous layer (<http://www.earthlife.net/fish/scales.html>). Ganoid scales evolved from cosmoid scales and have been found in lower actinopterygii species, such as bichirs, gars and sturgeons (http://en.wikipedia.org/wiki/Fish_scale). While elasmoid scales, as the most common scale type, have been found in a large number of teleost fishes. Based on the differences in scale shape, elasmoid scales can be categorized in two types: ctenoid (have a set of fine teeth along the posterior edge) and cycloid (have simply rounded on the outer or posterior edge). In some catfish species, the scales have become modified into bony plate to form an armour. This type of scale is called 'scutes', which is also found in sea horses and pinecone fish.

All fish scales are hypothesized to be evolved from a common ancestral element, the odontode (Sharpe, 2001). This can be easily observed in placoid scales from chondrichthyans. Both placoid scales and vertebrate teeth are composed of enamel, dentine and central pulp, and they are so called dermal denticles. In addition, cosmoid scales are thought derived from the fusion of placoid scales. Ganoid scales are derived from cosmoids. Elasmoid scales, found in most teleost fishes, however, are thought to be derived from a dental origin, and this theory has been proved through structural and developmental studies in zebrafish (Sire and Akimenko, 2004).

Though the morphology of fish scales is well studied, little is known about the genetic basis or molecular control of scale formation. In 1928, Rudzinsky reported that the phenotype of fully covered scale in common carp is dominant over the 'mirror' form (Rudzinsky, 1928a; 1928b).

Kirpichnikov later identified that two loci (S and N), with four alleles, were responsible for scale pattern (Kirpichnikov and Balkashina, 1935). Based on their description, scaled carps have genotype of SS/nn or Ss/nn, leather type carps have genotype of ss/Nn, linear type carps have genotype of SS/Nn or Ss/Nn, scattered carps are ss/nn and lethality with genotype NN/XX (SS, Ss or ss). This 'S' gene was found to be fibroblast growth factor receptor 1, and a duplicate copy of fibroblast growth factor receptor 1 showed decreases in scales formation in zebrafish (Rohner et al., 2009), indicated that this genes is relevant to scale pattern in fish. In medaka and zebrafish, it has been reported that the mutation of ectodysplasin (EDA) or ectodysplasin-A receptor (EDAR) leads to the loss or abnormal scales (Kondo et al., 2001; Harris et al., 2008; Lida et al., 2014). In addition, Sire and Akimenko (2004) indicated that sonic hedgehog molecule and its downstream pathway might be involved in the process of scale morphogenesis and differentiation in zebrafish.

Next generation sequencing and third generation sequencing technologies

Whole genome sequences is crucial for various genomic studies across the life sciences. Large scale whole genome sequencing projects started from "The Human Genome Project", which was declared completion in 2003. After that, with the continuous advances in sequencing technologies, particular the robot development next generation sequencing technologies, a number of genome sequencing projects for model species and non-model species arise. Recently, a 'Genome 10K' (G10K) project is established with the purpose of studying genome sequences of 10,000 vertebrate species. Generally, each one of these species represents for one vertebrate genus. (Genome 10k community of scientists, 2009).

Early on, part of human genome sequencing project was accomplished through Sanger-based capillary sequencing technology. However, recent development of new generation

sequencing technologies (include both the next generation and third generation sequencing technologies) have promised an even faster, more accurate and cheaper strategy. They dominant the market quickly due to its wide application in a variety of studies, including whole genome sequencing, transcriptome sequencing, non-coding RNA sequencing, gene expression studies, epigenetics analysis, and studies of discovering SNPs. With such wide range of potential applications, these new generation sequencing technologies have made major impacts on genomic and genetic studies in all organisms.

Currently, there are three dominant next generation sequencing technologies provided by 454 Roche Applied Science, Illumina, and the Applied Biosystems (Salem, 2012). Though these three technologies utilize different chemistries and sequencing steps, they are capable of generating large amount of data with relative low cost. For example, Roche 454 sequencer output about 0.7 Gb (Gigabase) data per 10-hour run, with the cost of 5,000 dollars. While Illumina Hiseq 2000 sequencer can generate 50-60 Gb data per run, with the cost of 3,000 dollars (Table 1).

454 sequencing system applies parallel pyrosequencing technology. Generally, fragmented and adaptor ligated single strand genomic DNA is bound to beads in the droplet of PCR-reaction-mixture-in-oil emulsion. Each bead captures single DNA sample and then goes through PCR reactions to amplify million copies of a unique DNA template. After that, the beads are evenly distributed into wells with each well contains single bead. One dNTP is then attached to the 3' end of DNA fragment and a pyrophosphate (PPi) group is released from the reaction. This released PPi pyrophosphate group is going to be utilized to synthesize adenosine triphosphate (ATP). This ATP then can be used to convert luciferin to oxyluciferin and release chemiluminescent signals, which will be captured by CCD camera embedded in the sequencer (Rothberg et al., 2008).

Illumina sequencing platforms, however, apply a different sequencing-by-synthesis technology. Briefly, DNA samples are sheared into fragments within the size of 150-200bp. After adding the adapters, single-strand fragments bind to the surface of the flow cell channels and form bridges. Bridge amplification will be initialized and turn into clusters, which consist of several identical copies of the original DNA template. Massively parallel sequencing is conducted simultaneously on millions of clusters to generate billions of nucleotide bases from a single run. Both single read and paired-end sequencing are available by Illumina's sequencing platforms (Figure 2a and 2b).

Figure 5a. Workflow of Illumina sequencing technology (Mardis, 2008)

Figure 5b. Workflow of Illumina sequencing technology (Mardis, 2008)

Another major next-generation sequencing platform is SOLiD (Sequencing by Oligonucleotide Ligation and Detection) sequencer, which is developed by Applied Biosystems. In general, two libraries are prepared and sequenced at the same time in single run. Template DNA is amplified through PCR reaction on beads in microreactors. Four sets of probes are ligated to the sequencing primers, which have already hybridized to the universal adapters on the template DNA. In order to distinguish probes from each other, they are fluorescently labeled at first two bases. After multiple cycles, second round of ligation with the start site at n-1 position (http://en.wikipedia.org/wiki/ABI_Solid_Sequencing). As such, each base is sequenced twice by two different sets of primers. This ensures SOLiD is a highly accurate sequencing technology.

SMRT (single molecular real time) sequencing method and Oxford Nanopore sequencing method are two primary third-generation sequencing technologies. SMRT sequencing is a parallel single molecule DNA sequencing technology developed by Pacific Biosciences (Rank et al., 2008). It utilizes the zero-mode waveguide (ZMW) technique. ZMW is a small structure where only one

base of DNA template can be incorporated by DNA polymerase. Fluorescent dyes labelled on tag will be detected during nucleotide incorporation in reaction (http://en.wikipedia.org/wiki/Single_molecule_real_time_sequencing). While Oxford Nanopore sequencing technology is filled with PCR reaction solvent, enzyme and voltage. During the sequencing process, an electric current change can be detected because of molecules passing through the nanopore (Clarke, et al., 2009). The comparison of all new generation technologies are listed in Table 1.

Table 1. Comparison of major new generation sequencing platforms.

	HiSeq 2000	SOLiD	454	Nanopore	Pac Bio
Principles	Sequencing by synthesis	Sequencing by ligation	Pyrosequencing	Exonuclease sequencing	SMRT
Throughput (data/run)	50-60 Gb	120 Gb	0.7 Gb	10 Gb/day	20GB
Cost per Giga base	\$40-60	\$110-130	\$7000	\$10-25	\$7000-38000
Read length	100PE	50+35bp/ 50+50bp	700bp	50-100 kb	3000bp
Read accuracy	99.2%	99.94%	98.9%	99%	85%

Genomic resources of ictalurid catfish

Catfish (*Ictalurus* spp.) is the predominant aquaculture species in the United States, which accounts for over 60% of all U.S. aquaculture production (USDA, 2006). Its production primarily includes channel catfish *Ictalurus punctatus*, blue catfish *Ictalurus furcatus* and their F1 hybrid.

However, the major aquaculture species is channel catfish (Liu, 2011b). As one of the top agriculture production in the southeastern United States, particular in the state of Mississippi, Alabama and Arkansas, over 130 million kilogram of catfish were processed every year, and the value of catfish industry is estimated around two billion dollars (Liu, 2011b).

In order to improve catfish production, several valuable production traits have been targeted in genetic selection programs. These traits include growth rate, feed conversion efficiency, disease resistance, seinability, low oxygen tolerance, temperature tolerance and processing yield (Peatman, 2012). Along with tremendous efforts toward improving the performance of these traits, diverse genomic resources have been developed in the past decade. These genomic resources are useful for better understanding of underlying biological processes of various traits in catfish, and further valuable for other functional genomics studies.

Many efforts of catfish genomic research were devoted to developing polymorphic markers (Liu and Cordes, 2004). In early days, these efforts mainly focused on dominant markers, such as RAPD (Liu et al, 1998a, 1999a) and AFLP (Liu et al., 1998b, 1999b). Later on, as a co-dominant marker, microsatellite markers were applied since 1997, (reviewed by Liu, 2011b; Liu et al, 1999c, 1999d; Tan et al., 1999; Liu et al., 2001; Karsi et al., 2002; Serapion et al., 2004; Xu et al., 2006; Li et al., 2007; Somridhivej et al., 2008; Lamkom et al., 2008; Wang et al., 2010). More recently, single nucleotide polymorphism (SNP) has been become a hot spot for molecular marker development due to its properties of high abundance (one SNP every 1250 bp in human genome), adaption to automation, and high resolution to reveal hidden polymorphisms which other markers cannot detect (Liu and Cordes, 2004; Zhang et al., 2012). As a result of this importance, SNPs development is playing an increasingly important role in catfish genomic research (Zhang et al., 2012). For example, hundreds of thousands SNPs have been explored from ESTs in catfish (He et

al., 2003; Wang et al., 2008, 2010). Most recently, with the development of catfish draft genome sequences, large amount of genome-wide SNPs have been identified Liu et al. (2011a). At the same time, a 250k SNP array was developed to conduct GWAS (genome-wide associate study) projects in catfish (Liu et al., 2014).

In addition to genetic markers, great efforts were made in capturing the catfish transcriptome. For example, about 500,000 catfish ESTs (354,377 from channel catfish and 139,475 from blue catfish) have been developed and submitted to GenBank dbEST (Ju et al., 2000; Cao et al., 2001; Karsiet al., 2002; Kocabas et al., 2002a, b; Nonneman and Waldbieser, 2005; Li et al., 2007; Wang et al., 2010). Depending on these EST resources, well characterized full-length cDNA set of catfish were reported by Chen et al. (2010). Moreover, microarray platforms with 19K and 28K genes were developed and applied for analyzing genes involved in immune responses of channel catfish and blue catfish (Li and Waldbieser, 2006; Peatman et al., 2008). Recently, whole transcriptome shotgun sequencing (RNA-Seq) has been proven as an efficient way to reveal the presence and quantity of transcripts in transcriptome at a given time, and has been well applied in catfish transcriptome studies (Li et al., 2012; Sun et al., 2012; Liu et al., 2013; Wang et al., 2013).

Other genomic resources developed in catfish include BAC end sequences, genetic linkage map, physical map, and the integration of linkage and physical map (Xu et al., 2006, 2007; Kucuktas et al., 2009; Ninwichian et al., 2012). Recently, channel catfish genome was sequenced from a double haploid channel catfish. Coupled with all the genomic resources developed in last decade, a reference catfish genome was assembled and annotated with the total coverage over 200 fold. As a result, channel catfish genome size is around 958 Mbp, and it contains 29,704 genes. Using this reference genome, Jiang et al., conducted whole genome comparative analysis between

channel catfish and four model fish species with fully sequenced genomes. These four fish species include zebrafish, medaka, stickleback and Tetraodon. It is concluded that catfish genome is most similar to the genome of zebrafish rather than other three model fish species.

Blue catfish draft genome sequences (unpublished data) were generated using Illumina's Moleculo sequencing technology. Because catfish share high identity in family ictaluridae, (for example, channel catfish and blue catfish share an average of 98.7% gene sequence identity), channel catfish and blue catfish genome were pooled together and used as reference genome of ictalurid catfish to conduct comparative genome analysis in this study.

Fish genome sequencing projects

Rapid development of sequencing technologies, particular the next generation sequencing, lead to the significant increasing of sequencing capacity and reduction of sequencing cost. Accordingly, whole genome-based analysis for fish species become technically and economically feasible. In table 2, fish species that genomes have been sequenced or currently be in sequencing process are summarized. Apparently, reference genome sequences will become available for more and more fish species in near future, and will be one of the most powerful genomic tools for functional genomics research in fish.

By far, zebrafish reference genome is considered as one of the best fish genome available. Zebrafish is a model organism which have been used for a variety of studies, including vertebrate development, development biology, and some human genetic diseases. Wellcome Trust Sanger Institute started zebrafish genome sequencing project in 2001 and has released several genome assemblies, the latest assembly is Zv9 (Church et al., 2011; Kerstin et al., 2013). Other sequenced or in sequencing projects are summarized below in table 2.

Table 2. Fish genomes that have been sequenced or currently in sequencing process (Data comes from G10K project (Bernardi et al., 2012), NCBI and Ensembl database).

Species	Common name	Publication
<i>Acipenser sinensis</i>	Chinese sturgeon	
<i>Amia calva</i>	Bowfin	
<i>Anguilla anguilla</i>	European freshwater eel	
<i>Aristichthys nobilis</i>	Bighead carp	
<i>Astatotilapia burtoni</i>	Burton's mouthbrooder

<i>Thunnus orientalis</i>	Pacific bluefin tuna	
<i>Xiphophorus maculatus</i>	Platyfish	

III. MATERIALS AND METHODS

Comparative analysis of gene contents between ictalurid catfish and other fish species with sequenced genomes

In order to evaluate the completeness of ictalurid catfish genome, comparative genomic analysis of gene contents were conducted between ictalurid catfish and other fish species. Because zebrafish genome is considered as the most complete reference genome have been released, similar comparative analysis were also conducted between zebrafish and other fish species. By far, there are eleven fish reference genome released in Ensembl database. These fish species include zebrafish (*Danio rerio*), Atlantic cod (*Gadus morhua*), medaka (*Oryzias latipes*), tilapia (*Oreochromis niloticus*), fugu (*Takifugu rubripes*), cave fish (*Astyanax mexicanus*), stickleback (*Gasterosteus aculeatus*), spotted gar (*Lepisosteus oculatus*), coelacanth (*Latimeria chalumnae*), platyfish (*Xiphophorus maculatus*), and tetraodon (*Tetraodon nigroviridis*). Protein datasets of these fish species were downloaded from FTP download server (<http://www.ensembl.org/info/data/ftp/index.html>) in Ensembl. Catfish genes used in this comparative analysis were retrieved from all resources available, including genome sequences, transcripts datasets, and protein datasets. BLASTP program (using protein sequences as queries to blast against protein database), BLASTX program (using nucleotide sequences as queries to blast against protein database) and TBLASTN program (using protein sequences as queries to blast against nucleotide database) were used for comparative genome analysis of gene contents between species. E-value threshold was set as 1e-5. Genes that didn't hit on reference genome were considered as specific genes in query species. Gene names were retrieved from Ensembl database

using

BioMart

program

(<http://useast.ensembl.org/biomart/martview/ba98d7d4183bfbe937efb32275c6e8c4>).

Blast searches can be categorized into four groups (Figure 6). When using zebrafish genes as queries to blast against other fish genomes, ‘no hit’ genes were considered as zebrafish specific genes (categorized as zebrafish+). In contrast, when using genes from other fish species as queries to blast against zebrafish genome, ‘no hit’ genes were considered as query fish specific genes (categorized as zebrafish-). Similarly, When using ictalurid catfish genes as queries to blast against other fish genomes, ‘no hit’ genes were considered as ictalurid catfish specific genes (categorized as catfish+). When using genes from other fish species as queries to blast against ictalurid catfish genes, ‘no hit’ genes were considered as query fish specific genes (categorized as catfish-).

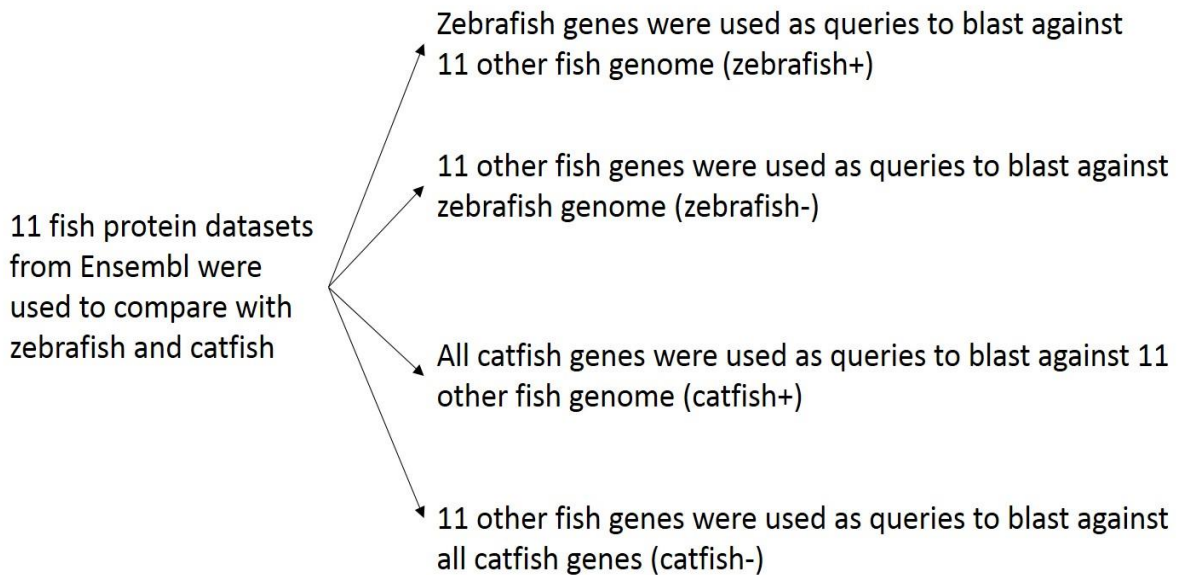

Figure 6. Schematic presentation of gene contents comparative analysis between catfish and other fish species.

Identification of the number of genes specifically present in the species, but absent from any other fish species.

In order to study the distinctiveness of gene contents in each fish species. Comparative genome gene contents analyses were conducted between each fish species and all other fish species genes pool. Take zebrafish as an example, all genes from other eleven fish species (include Atlantic cod, medaka, tilapia, fugu, cave fish, stickleback, spotted gar, coelacanth, platyfish, tetraodon, and ictalurid catfish) were pooled together first. Zebrafish genes were then used as queries to blast against with this genes pool. E-value threshold was set as $1e-5$. ‘No hit’ genes were identified as genes specifically present in zebrafish, but absent from any other fish species. Same method was applied for all other eleven fish species.

Identification of the number of genes specifically present in the species, but absent from other vertebrate species.

In order to study gene contents differences between fish species and other vertebrate species, comparative genomic analysis were conducted between fish species and higher vertebrate species. These higher vertebrate species include human (*Homo sapiens*), mouse (*Mus musculus*), rat (*Rattus norvegicus*), chicken (*Gallus gallus*), cow (*Bos taurus*), pig (*Sus scrofa*), and frog (*Xenopus tropicalis*). The protein database of all these higher vertebrate species were downloaded from Ensembl database and then pooled together. Protein database of each fish species was used as queries to blast against this higher vertebrate genes pool. E-value threshold was set as $1e-5$. ‘No hit’ genes were recognized as genes present in the each fish species but not identified from other higher vertebrate species. After the identification of fish specific genes for each species, total fish

specific genes were calculated through pooling them together and remove redundant genes, and the percentage of each fish species specific genes in total fish-specific genes was calculated.

DNA extraction and genome sequencing of common plecostomus and striped Raphael catfish

One common plecostomus fish with the weight of 14.97 g and length of 11.5 cm, and one striped Raphael catfish with the weight of 7.42 g and 6.8 cm were bought from local pet store. The fish was euthanized with tricaine methanesulfonate (MS-222) at 300mg/L (buffered with sodium bicarbonate) before blood was collected. Blood sample (500 µl for common plecostomus and 200 µl for striped Raphael catfish) was collected in a 1-ml syringe and immediately expelled into a 15-ml tube containing 5ml of cell lysis buffer (100 mM NaCl, 10 mM Tris, pH 8, 25 mM EDTA, 0.5% SDS, and 0.1 mg/ml freshly made proteinase K) for DNA isolation. The blood sample was incubated at 55 °C overnight and DNA was extracted with phenol and chloroform. DNA was precipitated by adding a half volume of 7.5 M ammonium acetate and 2 volume of ethanol. DNA was collected by brief centrifugation, and washed twice with 70% ethanol, air-dried, re-suspended in TE buffer (Tris-HCl, 10 mM, EDTA, 1 mM, pH 7.5), and quantified with a spectrophotometer.

DNA library preparation and genome sequencing process was carried out by HudsonAlpha Genomic Services Lab (Huntsville, AL, USA). Common plecostomus and striped Raphael catfish genome were sequenced in one lane on Illumina HiSeq 2000 instrument with 100bp paired-end (PE) reads, respectively. The major experiment steps were shown in Figure 7.

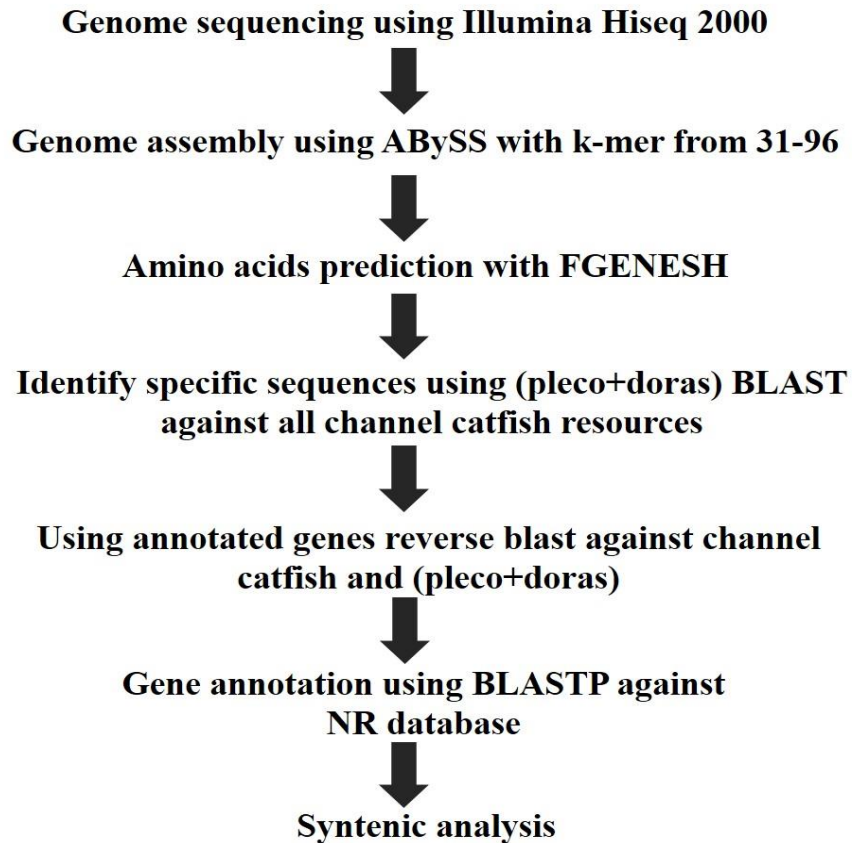

Figure 7. Flow chart of the experiment methods.

Whole genome *de novo* assembly of common plecostomus and striped Raphael catfish

Before assembly, raw sequencing reads were trimmed by removing reads whose quality score less than 20. The resulting high-quality reads were assembled into contigs using *de novo* sequence assembler ABySS (Assembly By Short Sequences) version 1.3.7. Briefly, continuous multiple k-mers were set ranging from 31 to 96 in ABySS. Best assembly will be determined by two major parameters: size of k-mer (chunks of sequences with length k) and N50 (contig length such that 50% of the *de novo* assembled genome lies in blocks of this size or larger). Afterwards, contigs that smaller than 200bp were removed and left sequences were regarded as final non-redundant contigs.

Genome size estimation for common plecostomus and striped Raphael catfish

Genome size of common plecostomus and striped Raphael catfish were estimated by JELLYFISH software (Marcais and Kingsford, 2011) embedded in MaSuRCA assembler. JELLYFISH is a tool for memory-efficient counting of Kmers in DNA. JELLYFISH firstly computed the number of occurrences of each Kmer and then generate a plot of the frequency of multiplicity for Kmers. Genome size was estimated using the total number of one good Kmer divided by the coverage of Kmer.

Gene annotation of common plecostomus and striped Raphael catfish

Open reading frames and amino acids of common plecostomus were predicted using FGENESH program from MOLQUEST (version 2.4) package. The predicted amino acids were further used as queries for BLAST searched against NCBI Non-Redundant (NR) protein sequence database. Annotation were conducted using the BLASTP program with an e-value cut-off of $1e-5$ and matching to the top hits. Unique genes were annotated through removing repeat genes, uncharacterized genes and unnamed genes.

Identification of specific genes in common plecostomus and striped Raphael catfish

With the availability of annotated genes from both channel catfish and two armored catfish, comparative gene contents analysis was able to be conducted in order to identify the specific genes in common plecostomus and striped Raphael catfish. In consideration of increasing sequencing

coverage, genes from common plecostomus and striped Raphael catfish were pooled together to conduct comparative genomic analysis. Genes from common plecostomus and striped Raphael catfish were used as queries to blast against all catfish genomic resources with e-value cut-off of $1e-5$ and matching to the top hits. These resources covered all the catfish datasets available, including several channel catfish genome sequences (from 'XY' catfish, 'YY' catfish and blue catfish), RNA-Seq datasets (almost cover all the tissues in catfish), ESTs, BAC contig specific sequences and BAC end sequences.

However, due to the fact that genome sequences from both channel catfish and two armored catfish may not be complete, particularly for common plecostomus and striped Raphael catfish, it is likely that orthologs in channel catfish and two armored catfish didn't hit each other during blast search because they match different positions of one gene. In such case, genes from NR database got from gene annotation step were used as queries to blast against channel catfish gene database and two armored catfish genes database. 'No hit' sequences were recognized as common plecostomus and striped Raphael catfish specific genes candidates.

Syntenic analysis of armored catfish-specific genes

Conserved synteny was defined as preserved co-localization of genes on chromosomes from different species. Shared syntenies were searched by examining the conserved co-localization of neighboring genes on scaffolds of channel catfish and other model species, such as zebrafish, medaka, frog, etc. Generally, in order to obtain the location information of these channel catfish genes on scaffolds, all identified specific genes in armored catfish were used as queries to search against genomes of other model species in Ensembl database. Neighbor genes on model species were then used as queries to blast against channel catfish genome to locate their orthologs

positions. As long as two sides of neighbor genes were conserved on scaffold of channel catfish genome, it was considered that these genes were located in a highly conserved synteny block.

IV. RESULTS

Generation and *de novo* assembly of whole genome shotgun sequences from common plecostomus and striped Raphael catfish

Comparative genome analysis is a straight-forward and powerful approach for investigating genomic differences among closely related species, and subsequently to better understand the biology features of the these species. With the availability of channel catfish whole genome sequences, it is feasible to conduct comparative genome analysis between channel catfish and other related species to validate the completeness of catfish genome assembly, as well as provide insights into catfish biological characteristics. However, such analysis is highly sensitive to the evolutionary relationships of related species. The shorter evolution distance between two related species, the better comparative analysis can be conducted. As such, I selected two armored catfish species, common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*) as representatives of related catfish species to conduct comparative genome analysis with channel catfish in order to shed lights into the completeness of channel catfish genome assembly and one significant biological feature of channel catfish, the lack of scales.

In consideration of lower cost and relative higher accuracy, Illumina based genomic DNA sequencing was carried out on common plecostomus and striped Raphael catfish. Genomic DNA was isolated from blood samples of the two armored catfish species. DNA samples were sequenced in one lane each for common plecostomus and striped Raphael catfish using Illumina HiSeq 2000 instrument with 100 bp paired end (PE) reads. As shown in Table 3, a total of 565.11 million and

326.33 million PE reads were generated for common plecostomus and striped Raphael catfish, respectively.

Because reference genomes are lacking in common plecostomus and striped Raphael catfish, *de novo* assembly was performed by de Bruijn assembler ABySS. To obtain an assembly that is of high quality, continuous multiple Kmers were tested from 31 to 96. As shown in Figure 8, initially, N50 increased with the increases of Kmers. When the Kmer increased to 58, the maximum of N50 was achieved (Figure 8). Therefore, Kmer of 58 was used for the sequence assembly of common plecostomus. Similarly, Kmer of 61 was optimal for Doras, which was used for sequence assembly of striped Raphael catfish (Figure 9).

The characteristics of the assembly for the genomes of the two catfish species are summarized in Table 3. With the common plecostomus genome, a total of 472,063 contigs with length over 200 bp were assembled. Three important statistics for the assessment of contiguity N50, N80, and N90 are 4,151 bp, 1,798 bp, and 1,113 bp, respectively. The average contig size is 2,156 bp and the maximum contig length is 78,410 bp. There are 68,329 contigs were longer than N50 size, thus longer than 4,151 bp.

In striped Raphael catfish, a total of 381,982 contigs with length over 200 bp were assembled. The N50, N80, and N90 of genome assembly are 4,413 bp, 1,788 bp, and 1,045 bp, respectively. The average contig size is 2,086 bp and the maximum contig length is 60,580 bp. Of the total 381,982 contigs, there are 50,774 contigs with length longer than N50 size.

Table 3. Summary of genomic sequencing and assembly of common plecostomus (Pleco) and striped Raphael catfish (Doras). *Genome sequence coverages are based on estimated genome sizes of 1.1 Gb and 0.8 Gb for Pleco and Doras, respectively using MaSuRCA (see below)

	Pleco	Doras
Sequencing reads	565.11 million	326.33 million
Estimated sequencing coverage*	~50 fold	~40 fold
Contig number over 200 bp	472,063	381,982
N:N50	68,329	50,774
N50 (bp)	4,151	4,413
N80 (bp)	1,798	1,788
N90 (bp)	1,113	1,045
Max (bp)	78,410	60,580
Average length (bp)	2,156	2,086

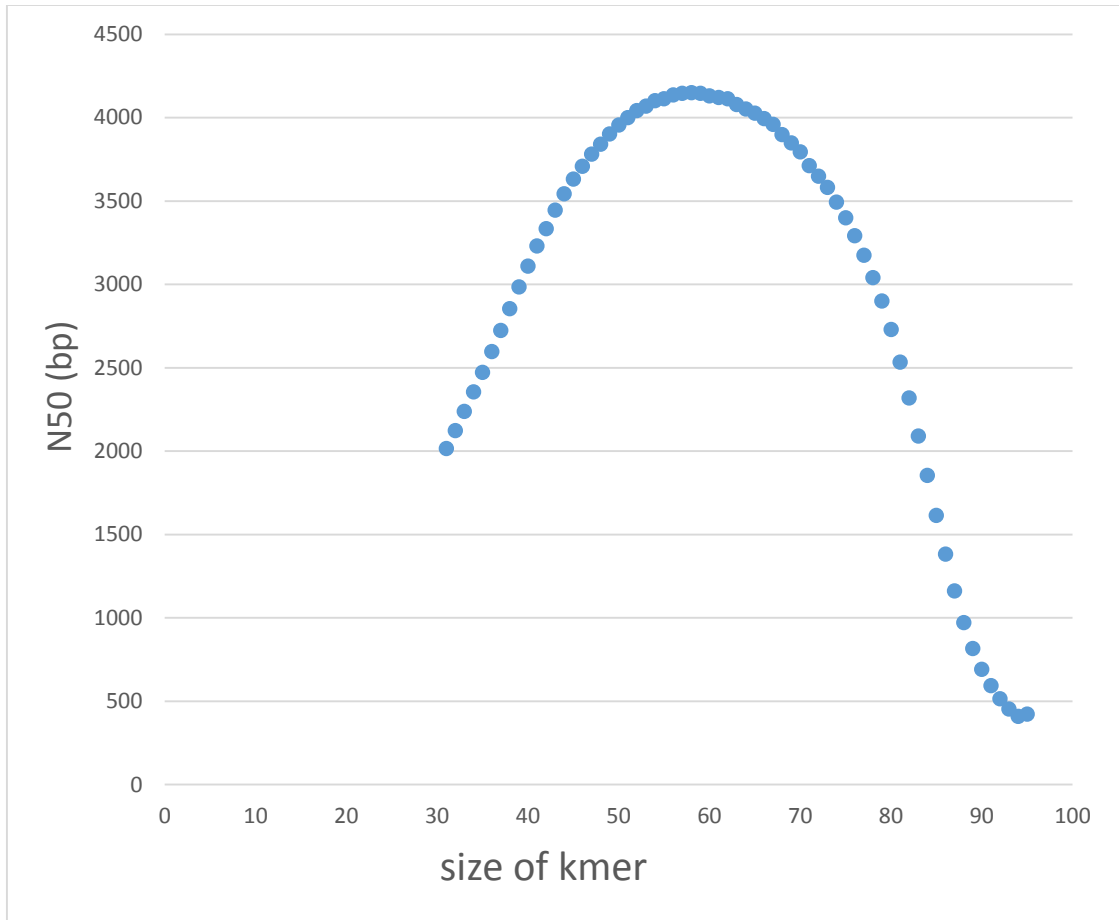

Figure 8. Determination of optimal Kmer for the assembly of whole genome sequences of common plecostomus. X-axis is the size of K-mer, and Y-axis is N50 size of the assembly.

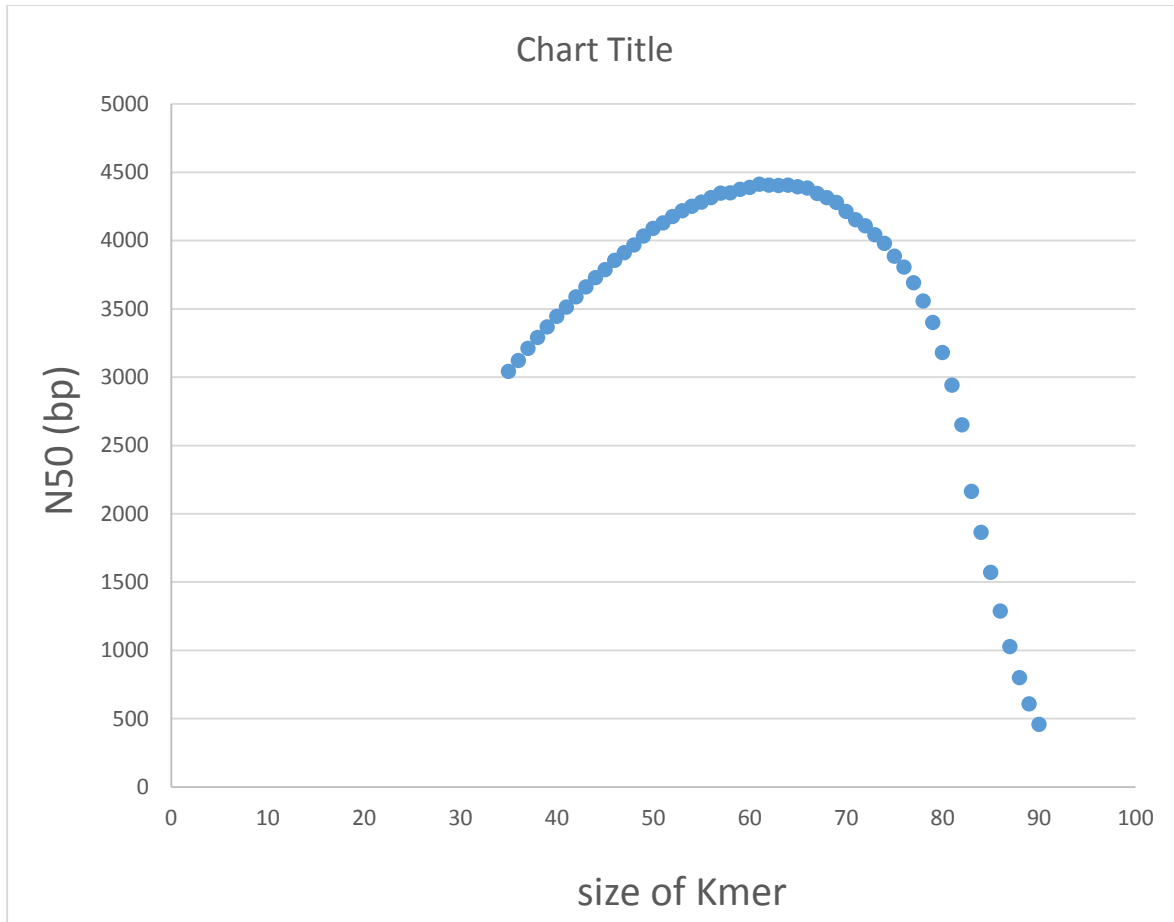

Figure 9. Determination of optimal Kmer for the assembly of whole genome sequences of common Doras. X-axis is the size of Kmer, and Y-axis is N50 size of the assembly.

Estimation of genome size of common plecostomus and striped Raphael catfish

In order to calculate sequencing coverage for common plecostomus and striped Raphael catfish, genome size of two species need to be estimated first. Software JELLYFISH estimated the genome size from the Kmer coverage and total number of non-error Kmers. In common plecostomus, the genome size is estimated as 1.1 Gb. The genome size of striped Raphael catfish is estimated as 0.8 Gb. Since the yield of two sequencing are 565.11 million reads and 326.33 million reads, the sequencing coverage for common plecostomus and striped Raphael catfish are around 50 fold and 40 fold, respectively.

Genome annotation of common plecostomus and striped Raphael catfish

Open reading frames and amino acids were predicted using FGENESH program from whole genome sequences of common plecostomus and striped Raphael catfish. The predicted amino acids were then further used as queries for BLAST searches against NCBI non-redundant (NR) protein sequence database. Searches were conducted using the BLASTP program with an E-value cut-off of $1e-5$, and matches to the top hit were recorded. A total of 40,640 and 35,118 unique NR IDs were identified in common plecostomus and striped Raphael catfish genome, respectively. Retrieving of these NR IDs indicate there are many redundant genes in the database. After removing the repeated genes, uncharacterized genes, and unnamed genes, a total of 28,122 unique genes (listed in Supplemental Table 1) were annotated in common plecostomus and 26,190 unique genes in striped Raphael catfish (listed in Supplemental Table 2).

Comparative analysis of gene contents between ictalurid catfish and other fish species with sequenced genomes

Although sequence assembly parameters provide a general picture of the quality of sequencing assemblies, the completeness of the genome sequences cannot be easily assessed. In order to provide insights into the completeness of the ictalurid catfish genome sequence assembly and related genome resources, comparative analysis of gene contents was conducted between ictalurid catfish and other fish species with sequenced genomes.

Twelve fish genomes were analyzed for their gene contents. These included zebrafish, Atlantic cod, medaka, tilapia, fugu, cave fish, stickleback, spotted gar, coelacanth, platyfish,

tetraodon, and channel catfish (Table 4). Among these, the genomes of seven species have been published including zebrafish (Howe et al., 2013), Atlantic cod (Star et al., 2011), medaka (Kasahara et al., 2007), tilapia (Guyon et al., 2012), fugu (Aparicio et al., 2002), stickleback (Jones et al., 2012), and tetraodon (Jaillon et al., 2004), and these genomes, as well as the remaining 4 genomes were available from the ENSEMBL database. Coding sequences from these eleven fish species were retrieved from the ENSEMBL database and used for analysis of gene contents. Coding sequences of ictalurid catfish were obtained through analysis of the ictalurid catfish whole genome sequence assembly, its transcriptome assemblies and its protein database.

As summarized in Table 4, total gene numbers were identified from database of twelve fish species. In eleven fish species retrieved from ENSEMBL database, zebrafish genome contains the largest gene number of 26,450, while fugu has the smallest number of genes, with only 16,958 genes retrieved from its database. A total 29,704 genes were identified from all ictalurid catfish genomic resources.

Table 4. Total gene numbers of twelve fish species used in comparative genome analysis

Species	Database version	Number of genes identified from the genomes
Zebrafish	Zv9	26,450
Atlantic Cod	v1.75	20,095
Medaka	v1.75	19,699
Tilapia	v1.0.75	21,437
Fugu	v4.75	16,958
Cave fish	v102.75	23,042
Stickleback	v1.75	20,787
Spotted gar	v1.75	18,341
Coelacanth	v1.75	19,569

Platyfish	v4.4.2.75	20,379
Tetraodon	v8.75	19,602
Catfish	-	29,704

To assess the completeness of the ictalurid catfish genome, one approach is to determine the number of genes identified from the genome sequence assembly and related genome resources. Because the zebrafish genome has been regarded as “complete” with nine versions of assemblies (Howe et al., 2013), here I compared the gene contents of various fish species with those of zebrafish. In the first step of this analysis, the zebrafish protein sequences were used as queries to conduct BLASTP analysis. If homologous sequences exist in the genomes of other fish species, “hits” were generated. In contrast, if no hits were observed, the zebrafish protein sequences were regarded as being present in zebrafish, but absent in the fish genome under comparison (zebrafish+, genes were listed in supplemental Table 3). Conversely, I also conducted BLASTP analysis using protein sequences from various fish species as queries against the zebrafish protein database. If hits were observed, the proteins were regarded being present in the zebrafish genome. If the hits were not observed, the proteins were regarded being absent from the zebrafish genome (zebrafish-, genes were listed in supplemental Table 4).

Table 5 listed the number and percentage of genes present in zebrafish, but absent from other fish species (zebrafish+). Through the comparison, the number of genes “missing” from other fish species as compared to zebrafish varied from 780 to 2,594. Compared with the zebrafish genome, the channel catfish genome ‘missed’ the smallest number of genes (780, 2.95% of zebrafish genes) followed by cave fish (1,195, 4.52% of zebrafish genes), spotted gar (1,386, 5.24% of zebrafish genes), and platyfish (1,455, 5.5% of zebrafish genes). Fugu (2,407, 9.81% of

zebrafish genes) and tetraodon (2,436, 9.21% of zebrafish genes) missed the largest number of genes.

It should be noted that the numbers of genes present in the zebrafish genome but absent from the genomes of other fish is a variable affected by a number of factors. Such factors could be related to the completeness of the genome as well as the evolutionary relationship of the fish species. In general, the more completed the genomes are, the smaller the number of zebrafish+ genes should be. Similarly, assuming the genomes were complete, the more closely related the fish is to zebrafish in evolution, the smaller the number of zebrafish+ genes should be. However, it is apparent that many genomes were incomplete, and therefore, around 1,000~2,000 genes were missed from these fish genome database. Obviously, the completeness of ictalurid catfish genome is relatively closely related to zebrafish. In this comparison, 780 zebrafish+ genes were found for the ictalurid catfish, the smallest number among all the genomes analyzed. This suggested that the ictalurid catfish genome could be relatively more complete.

Table 5. Number and percentage of genes present in zebrafish, but absent in other fish species.

Species	Genes present in the zebrafish genome but not (yet) identified in the species	% “missing”
Atlantic Cod	1,985	7.50%
Medaka	2,153	8.14%
Tilapia	1,613	6.10%
Fugu	2,594	9.81%
Cave fish	1,195	4.52%
Stickleback	1,877	7.10%
Spotted gar	1,386	5.24%
Coelacanth	2,021	7.64%

Platyfish	1,455	5.50%
Tetraodon	2,436	9.21%
Catfish	780	2.95%

In the second step of this analysis, the catfish genes were used as queries to conduct genome comparative analysis. Similar with zebrafish BLAST search, “hits” were generated if homologous sequences exist in the genomes of other fish species. In contrast, if no hits were observed, the ictalurid catfish genes were regarded as being present in ictalurid catfish, but absent in other fish genome under comparison (catfish+, genes were listed in supplemental Table 5). BLAST analysis were also conducted using protein sequences from various fish species as queries against the catfish protein database. If hits were observed, the genes were regarded being present in the ictalurid catfish genome. If the hits were not observed, the genes were regarded being absent from the ictalurid catfish genome (catfish-, genes were listed in supplemental Table 6).

As shown in Table 6, the number of genes that identified from the ictalurid catfish genome but not from the genome of other species (catfish+) varied from 987 (zebrafish) to 2,738 (tetraodon). Compared with the ictalurid catfish genome, the zebrafish genome ‘missed’ the smallest number of genes (987) followed by cave fish (1,537), spotted gar (1,559), platyfish (1,853), and tilapia (1,882). Number of genes absent in ictalurid catfish but found in other fish genomes (catfish-) were all much less than ‘catfish+’ numbers. Apparently, the true number of gene contents is unknown at present as we do not know the completeness of these genome assemblies. However, such comparative genome analysis could indicate that the ictalurid catfish genome sequences is as complete as zebrafish, and much more complete than genomes from other ten fish species.

Table 6. Comparison of gene contents among fish species. ‘+’ indicates to use sequences of corresponding species as queries in blast; ‘-’ indicates to use sequences of corresponding species as references in blast

Species	zebrafish+	zebrafish-	catfish+	catfish-
Catfish	780	987		
Zebrafish			987	780
Cave fish	1195	371	1537	302
Spotted gar	1386	588	1559	397
Platyfish	1455	387	1853	339
Tilapia	1613	368	1882	324
Stickleback	1877	1210	2146	1054
Coelacanth	2021	1090	2321	583
Medaka	2153	1403	2349	1174
Atlantic Cod	1985	818	2391	720
Fugu	2594	108	2656	100
Tetraodon	2436	410	2738	388

Identification of the number of genes specifically present in the species, but absent from any other fish species.

In order to study the distinctiveness of gene contents in each fish species, comparative genome analysis were conducted between each fish species and all other fish species gene pool (All these genes were listed in supplemental Table 7). As shown in Table 7, medaka possesses the largest number of specific genes (838) in comparison with other fish species, followed by zebrafish (650), stickleback (648) and ictalurid catfish (481). Fugu (15) and platyfish (83) have least number of specific genes. It should be noted that the numbers of genes specifically present in fish species but absent from all other fish species is affected by the two factors. These two factors are the

completeness of the genome and the evolutionary relationship of the fish species. In general, the more completed the genomes are, the larger number of fish species specific genes identified. Similarly, assuming the genomes were complete, the more fish species evolutionary distantly related to all other fishes, the greater number of genes that are present in the fish species but absent from other species.

Table 7. Number of genes specifically present in the species, but not identified from any other fish.

Species	Number of genes specifically present in the species, but not identified from any other teleost fish in the species
Medaka	838
Zebrafish	650
Stickleback	648
Catfish	481
Coelacanth	379
Atlantic Cod	374
Tetraodon	208
Spotted gar	182
Tilapia	145
Cave fish	124
Platyfish	83
Fugu	15

Identification of the number of genes specifically present in the species, but absent from other vertebrate species.

In order to study fish specific genes, comparative genome analysis were conducted between fish species and other vertebrate species. Seven vertebrate coding sequences database were pooled together as reference in this analysis, including human (*Homo sapiens*), mouse (*Mus musculus*), rat (*Rattus norvegicus*), chicken (*Gallus gallus*), cow (*Bos taurus*), pig (*Sus scrofa*), and frog (*Xenopus tropicalis*). ‘No hit’ genes were recognized as genes present in the each fish species but not identified from other higher vertebrate species. In the first step, specific genes for each fish species were identified, pooled together and removed redundant genes. As a result, a total of 6,644 genes were identified as genes present in twelve fish species but absent in seven higher vertebrate species. After this, percentage of fish specific genes in total fish specific genes was calculated. As shown in Table 8, medaka (1691), ictalurid catfish (1650), zebrafish (1519) and stickleback (1450) have most fish specific genes in comparison with other vertebrates. While fugu (96), tetraodon (467) and spotted gar (493) were top three species with least specific genes compared with other vertebrates. Completeness of genome, evolutionary relationships between species and higher vertebrates, as well as genome duplication condition could be the reasons lead to the results.

Table 8. Number of genes specifically present in the species, but not identified from higher vertebrate species.

Species	Number of genes present in the fish species, but not identified from organisms other than teleost fish in the species	% of total fish-specific genes identified from the species (6,644 total fish specific genes)
Zebrafish	1519	22.86%
Atlantic Cod	1052	15.83%
Medaka	1691	25.45%

Tilapia	539	8.11%
Fugu	96	1.44%
Cave fish	614	9.24%
Stickleback	1450	21.82%
Spotted gar	493	7.42%
Coelacanth	619	9.32%
Platyfish	570	8.58%
Tetraodon	467	7.03%
Catfish	1650	24.83%

Comparative gene contents analysis between two armored catfish and channel catfish

Comparative genome analysis is a powerful approach in genomics studies, especially when it is conducted among species with close evolutionary relationships. As such, in my dissertation, two armored catfish species, common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*) were selected to conduct comparative genome analysis with ictalurid catfish.

All armored catfish genome sequences were first filtered with ictalurid catfish gene database. As shown in Figure 10, there are 566 genes and 329 genes left in common plecostomus and striped Raphael catfish genome. Through reverse blast search, 116 genes and 117 genes were left in common plecostomus and striped Raphael catfish, respectively. 23 and 26 repetitive elements were removed from genes left. As listed in table 9, after filtering through all ictalurid catfish genomic resources and reverse blast search, a total of 167 genes were identified as armored catfish-specific genes. Among these, 93 genes were found from common plecostomus (listed in supplemental table 9) genome assembly, and 91 genes were found from striped Raphael catfish genome (supplemental table 10). There are 17 genes overlap in both databases. Gene functions

were described in table 3. Of these 167 genes, 11 gene functions can be searched based on their identities.

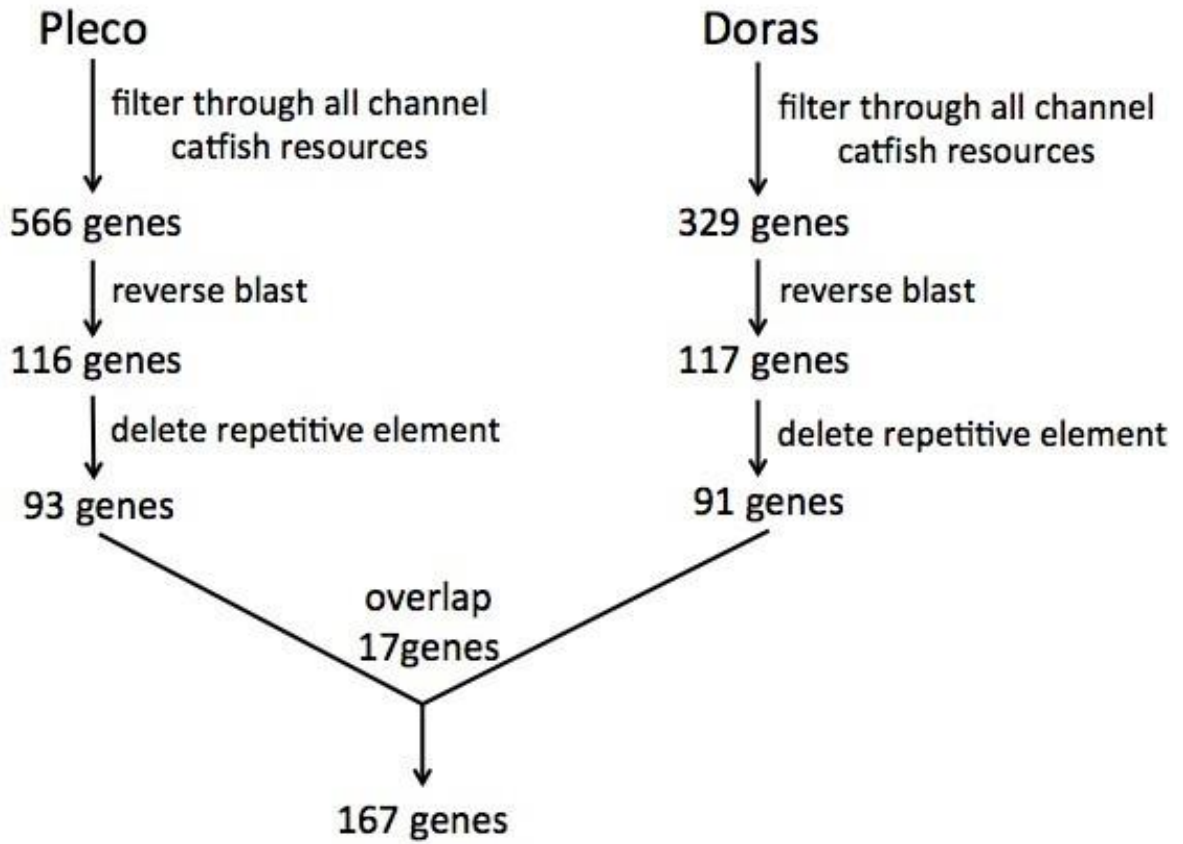

Figure 10. Pipeline for identification the specific genes in common plecostomus and striped Raphael catfish. ‘Pleco’ is short name for common plecostomus. ‘Doras’ is short name for striped Raphael catfish.

Table 9. Armored catfish-specific genes. ‘P’ indicates genes were identified from common plecostomus genome. ‘D’ indicates genes were identified from striped Raphael catfish genome database.

Conserved syntenic analysis for armored catfish-specific genes

Conserved synteny represents a block of genes with conserved contents and order on the chromosome. It is a valuable analysis not only for functional genomics studies, but also for evolutionary studies (Ravi and Venkatesh, 2008). As such, conserved syntenic analysis was applied to determine whether armored catfish-specific genes were truly missing in the ictalurid catfish genome. As shown in Figure 9- Figure 30. Among 167 armored catfish-specific genes, conserved synteny blocks were found for 22 genes. These genes include si:ch1073-126c3.2 precursor, interphotoreceptor matrix proteoglycan 1, osteocrin-like, protein pitchfork, zgc:103625, Zgc:92753 protein, uncharacterized protein LOC100535760, uncharacterized protein LOC100536200, uncharacterized protein LOC101731862, uncharacterized protein LOC101882148, uncharacterized protein LOC101882486, uncharacterized protein LOC101883033, uncharacterized protein LOC101883359, uncharacterized protein LOC101884034, uncharacterized protein LOC101884312, uncharacterized protein LOC102075856, uncharacterized protein LOC100333395, uncharacterized protein LOC100495238, uncharacterized protein LOC101883128, uncharacterized protein LOC101883233, uncharacterized protein LOC101883544, and uncharacterized protein LOC101883788. Within the 22 conserved syntenic blocks, the armored catfish-specific genes were found, but they were absent from the ictalurid catfish genome containing these conserved syntenic blocks, suggesting they were truly missing from the ictalurid catfish genome although their translocation to other genomic locations of the catfish genome cannot be ruled out.

As zebrafish genome is regarded as “complete” and zebrafish harbors scales, the conserved syntenic analysis was parallel conducted with the zebrafish genome. Of the conserved syntenic

blocks for the 22 genes, the armored catfish-specific genes were found in 20 conserved syntenic blocks.

Of these 22 genes, two genes were annotated with known functions related to bone or scale formation, osteocrin gene and pitchfork gene. These two genes were then searched in other eleven fish genome databases and conducted syntenic analyses. As shown in Table 10, the ortholog of osteocrin gene can be found in six fish genomes, including zebrafish, tilapia, cave fish, spotted gar, coelacanth, and platyfish. The ortholog of pitchfork gene can be searched in five fish genome, including zebrafish, cave fish, spotted gar, coelacanth, and platyfish. Syntenic analysis (Figure 12) indicated the osteocrin gene is highly conserved in six fish genome. The highly conserved syntenic blocks of pitchfork gene were found between channel catfish and zebrafish, as well as channel catfish and platyfish, while it is less conserved in cave fish, coelacanth, and spotted gar. This may be caused by the longer evolutionary distance between channel catfish and these three species.

V. DISCUSSIONS

Comparative genome analysis of related species is a powerful tool in genomics studies. Rapid development of genomic resources in ictalurid catfish, particularly the recent sequencing of

the whole genome from channel catfish and blue catfish has provided a great opportunity for conducting comparative genome analysis between ictalurid catfish and related fish species. Such comparison should provide assessment for the completeness of the ictalurid catfish genome. In addition, by examination of the genes present or absent from ictalurid catfish, speculations can be made as to if the absent of these genes may be related to its specific biological characteristics.

Four parameters are essential for the assessment of channel catfish genome. They are accuracy, completeness, contiguity and connectivity. The aim of this study is to evaluate the completeness of channel catfish genome assembly through comparative genome analysis between channel catfish and two armored catfish species, as well as channel catfish and other fish species with sequenced genomes. In addition, the two selected catfish species, common plecostomus (*Hypostomus plecostomus*) and striped Raphael catfish (*Platydoras armatulus*), harbor scute-type scales. Through comparative genome analysis, especially through comparison of gene contents, insights into the possible genes or gene pathways involved in the scale formation could be provided.

To date, eleven fish genome sequences have been submitted into Ensembl database. These fish species include zebrafish, Atlantic cod, medaka, tilapia, fugu, cave fish, stickleback, spotted gar, coelacanth, platyfish, and tetraodon. Together with channel catfish, a variety of comparative genome analysis were conducted between zebrafish and other fish species, between channel catfish and other fish species, as well as between fish species and other vertebrate species. These analysis could provide some clues about the completeness of the ictalurid catfish genome sequence assembly and related genome resources.

Zebrafish genome has been regarded as the most complete genome in fish species. Through the comparisons of gene contents with other fish genome sequences, it can be concluded that the catfish genome sequences are likely to be as complete as the zebrafish genome, because: 1) In

comparison with other fish species, there was not much significant discrepancy between channel catfish gene database and zebrafish genome. Through the comparison between two species, there are 987 genes present in ictalurid catfish gene database but absent in zebrafish genome, and there are 780 genes present in zebrafish genome but absent in ictalurid catfish gene database. In comparison, the zebrafish+ or catfish+ genes were much larger with other fish species, suggesting that the catfish genome is more complete than that of the other fish species analyzed, and close to the completeness of the zebrafish genome; 2) Through the comparison with other vertebrate species, catfish gene database has 1,650 genes present in ictalurid catfish but not identified in higher vertebrate species. Similarly, there are 1,519 genes present in zebrafish but not identified in higher vertebrate species. Though both factors of completeness and evolutionary relationships will affect the species specific gene number, completeness should play a dominant role in this comparative genome analysis, because zebrafish and catfish both belong to fish group compared with other vertebrate groups, indicating that the completeness of ictalurid catfish gene database is similar to zebrafish genome.

However, over one thousand specific genes identified from these comparative analyses made the downstream validation experiment difficult to process. With this consideration, two evolutionary related catfish species, common plecostomus and striped Raphael catfish were selected in this study to conduct comparative gene contents analysis with ictalurid catfish. In addition, though there are several possibilities leading to scale loss in ictalurid catfish, such as exons frame shift, promoter mutation, epigenetics, mutations in regulators of scale related pathways, etc., my dissertation focuses on one of the possibilities, the scale related genes lost during evolution process. Through comparative genome analysis, especially through comparison of their genes, insights into the possible genes or gene pathways involved in the scale formation

could be inferred. As the fact that ictalurid catfish is scaleless, specific genes identified in armored catfish species may provide hints for a candidate gene pool that lead to the scale loss in ictalurid catfish during the evolution process.

Genome sequencing of two armored catfish species was conducted using Illumina next generation sequencing technology. Around 50 fold coverage for two armored catfish together allowed whole genome comparative analysis of catfish conducted with a well-assembled reference sequences. After annotation, 28,122 unique genes and 26,190 unique genes were identified in common plecostomus and striped Raphael catfish genome, respectively. These number is much similar to the channel catfish, suggesting a good sequencing and assembly in the study and close evolutionary relationship among these catfish species. For gene identification purposes, sequencing of just one exon or a gene segment was sufficient to identify the gene, thus allowing the gene contents to be compared between the catfish species.

There are several possibilities could lead to scale loss in ictalurid catfish, such as exons frame shift, mutations in promoter region, epigenetic factors, mutations in regulators of scale related pathways, etc., however, my dissertation focuses on one of the possibilities, the scale related genes lost during evolution process. Using the strategies developed in this study, a total of 167 specific genes were identified in two armored catfish species. There are three possibilities for these 167 genes: 1) they are truly lost in channel catfish genome during evolution process, and may represent candidate genes important for distinct phenotypes armored catfish possess, such as armored with scales; 2) these genes might exist in the ictalurid catfish genome, but have low similarities with their homologs due to high rate of mutation in the evolution, these situation can be excluded through conducting syntenic analysis with other species; 3) these genes might exist in

the ictalurid catfish genome, but have not yet been identified because of the incompleteness of the ictalurid catfish genome sequencing and assembly.

Conserved syntenic analysis is a valuable tool for functional genomics and evolutionary studies. In my study, conserved syntenic analysis was applied to determine whether armored catfish-specific genes were truly missing in ictalurid catfish genome. As a result, of the 167 armored catfish-specific genes, conserved synteny blocks were identified for 22 genes (si:ch1073-126c3.2 precursor, interphotoreceptor matrix proteoglycan 1, osteocrin-like, protein pitchfork, zgc: 103625, Zgc:92753 protein, uncharacterized protein LOC100535760, uncharacterized protein LOC100536200, uncharacterized protein LOC101731862, uncharacterized protein LOC101882148, uncharacterized protein LOC101882486, uncharacterized protein LOC101883033, uncharacterized protein LOC101883359, uncharacterized protein LOC101884034, uncharacterized protein LOC101884312, uncharacterized protein LOC102075856, uncharacterized protein LOC100333395, uncharacterized protein LOC100495238, uncharacterized protein LOC101883128, uncharacterized protein LOC101883233, uncharacterized protein LOC101883544, and uncharacterized protein LOC101883788). Within these 22 conserved syntenic blocks, the gene of interest (found to be “armored catfish-specific) were present in zebrafish or other species, but absent from the ictalurid catfish conserved blocks.

Although the absence of the genes within the channel catfish syntenic blocks suggest that they are missing in the channel catfish genome, this alone does not provide whole evidence that such genes are missing from the channel catfish genome. One possibility is that these genes are still present in the catfish genome but in a different location. Therefore, additional research is required to provide concrete evidence for the loss of these genes in the catfish genome. One

possibility is Southern blot analysis, or dot blot analysis, where the probes of these genes can be made to hybridize to the genomic DNA from the armored catfish and channel catfish. If homologous sequences exist in the channel catfish, then such genes may still be present in the catfish genome. In contrast, if the Southern blot does not reveal the presence of any homologous sequences, it would be more confident to conclude that such genes are indeed missing from the catfish genome. This same approach can be applied to testing all the 167 genes that are designed as “armored catfish-specific.

One way of obtaining any hints as to if the armored catfish-specific genes are related to biological characteristics of channel catfish is through examination of their biological functions and gene pathways. However, this approach had very limited application as the vast majority of the armored catfish-specific genes cannot be annotated. Of the 167 genes, only 11 genes can be annotated. The most of 167 genes had homology to genes that were designated as Hypothetical proteins, or uncharacterized proteins (Table 9).

Of these 22 genes that were absent in the channel catfish syntenic blocks, only three were annotated with functional gene names. They are interphotoreceptor matrix proteoglycan 1, osteocrin-like, and protein pitchfork. Of these, the osteocrin and pitchfork genes were functionally related to bone formation or scale development. The osteocrin gene, also known as musclin, has been reported as a novel bone-active molecule and involved in modulating osteoblastic differentiation function (Thomas, et al., 2003). It is highly expressed in osteoblast cells, and specifically localized to osteoblasts and young osteocytes at bone-forming sites (Bord, et al., 2005). However, there are no publications have indicated that this gene is related with scale formation. Pitchfork protein has been reported as an essential protein for cilia disassembly (Kinzel et al., 2010). Primary cilia plays an important role in sonic hedgehog (Shh) signaling pathway and

failure of cilia formation will lead to embryonic defects (Sasai and Briscoe, 2012). Pitchfork gene is expressed in regions of intensive Shh signaling in the mouse embryo, and regulated by Shh agonist in cell culture, suggesting that pitchfork might function in the Shh signaling pathway (Sasai and Briscoe, 2012). Because Shh signaling pathway is involved in the control of scale morphogenesis and differentiation (Sire and Akimenko, 2004), it is possible that the loss of pitchfork gene in ictalurid catfish lead to the scale loss during evolution (Figure 33).

The ortholog of osteocrin gene was found to be present and highly conserved in other six scale-harbored fish species, including zebrafish, tilapia, cave fish, spotted gar, coelacanth and platyfish. Pitchfork gene was found in five scale-harbored fish species and highly conserved with zebrafish and platyfish. There are two possible reasons that osteocrin and pitchfork genes are absent in other scale-harbored fish, such as medaka, Atlantic cod and stickleback, 1) genomes of these fish species are not complete, and these genes were missed; 2) osteocrin and pitchfork genes might be related to other functions instead of forming scales, which could be missed in such comparison. Further functional analysis are required to confirm these hypotheses.

VI. CONCLUSION

Through the comparative genome analysis among fish species, ictalurid catfish gene database is more complete than other fish species, and close to the completeness of zebrafish genome. Comparative genome analysis were conducted between ictalurid catfish and two armored catfish. As a result, of the 167 armored catfish-specific genes were identified. Whether these 167 genes are truly absent from the ictalurid catfish genome is still unknow at present. Conserved syntenic analyses indicated that 22 genes were present in zebrafish or other genomes but were

absent from the ictalurid catfish conserved syntenic blocks, providing stronger evidence that they may be truly missing from the ictalurid catfish genome, but additional analyses are required to confirm this. Although a couple of genes are interesting for scale formation (osteocrin and pitchfork protein), their relationship with scaleless phenotype of channel catfish is only speculation at this time.

Supplemental table 1. Common plecostomus unique gene list

ID	gene_name (unique gene names)
NP_998225.1	3-methyl-2-oxobutanoate dehydrogenase lipoamide kinase, mitochondrial
NP_001187592.1	Protein ADP-ribosylarginine hydrolase
NP_001104628.1	Pyruvate dehydrogenase acetyl-transferring -phosphatase 1, mitochondrial
NP_957290.1	Pyruvate dehydrogenase lipoamide kinase isozyme 2, mitochondrial
ELW48285.1	Pyruvate dehydrogenase lipoamide kinase isozyme 3, mitochondrial
NP_001122176.1	Pyruvate dehydrogenase lipoamide kinase isozyme 4, mitochondrial
NP_001135332.1	1,2-dihydroxy-3-keto-5-methylthiopentene dioxygenase
ADI60062.1	11 beta-hydroxysteroid dehydrogenase type 2
NP_956802.2	116 kDa U5 small nuclear ribonucleoprotein component
NP_035561.1	116 kDa U5 small nuclear ribonucleoprotein component isoform a
NP_001117736.1	11-beta-hydroxylase
NP_001025272.1	11-cis retinol dehydrogenase
NP_001070178.2	12-lipoxygenase
ADF97628.1	14 kDa apolipoprotein
NP_001188125.1	14 kDa phosphohistidine phosphatase
ELK30240.1	14-3-3 protein beta/alpha
ACO09912.1	14-3-3 protein beta/alpha-2
NP_997770.1	14-3-3 protein epsilon
NP_998187.1	14-3-3 protein gamma-1
EFN72044.1	14-3-3 protein zeta
NP_001117942.1	14-3-3C1 protein
NP_001117944.1	14-3-3E1 protein
AAR89625.1	14-alpha demethylase
NP_001134545.1	15.5 kDa protein
ACM09410.1	15-hydroxyprostaglandin dehydrogenase
ACN66287.1	17 beta hydroxysteroid dehydrogenase 4
AAS58451.1	17-beta hydroxysteroid dehydrogenase type 3
ACI69584.1	17-beta-hydroxysteroid dehydrogenase 14
ELK17735.1	182 kDa tankyrase-1-binding protein
ACY30369.1	1-acylglycerol-3-phosphate O-acyltransferase 3
NP_998157.1	1-acyl-sn-glycerol-3-phosphate acyltransferase delta
NP_001070213.2	1-acyl-sn-glycerol-3-phosphate acyltransferase epsilon
NP_998590.1	1-acyl-sn-glycerol-3-phosphate acyltransferase gamma
NP_001133648.1	1-acyl-sn-glycerol-3-phosphate acyltransferase zeta
NP_001014345.1	1-aminocyclopropane-1-carboxylate synthase-like protein 1
NP_001133318.1	1-O-acylceramide synthase precursor
NP_001092893.1	1-phosphatidylinositol 4,5-bisphosphate phosphodiesterase delta-3-A
NP_001120777.1	1-phosphatidylinositol-3-phosphate 5-kinase
NP_001116245.1	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase beta-3
NP_001167177.1	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase delta-4
NP_001155125.1	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase epsilon-1
NP_919388.1	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase gamma-1
NP_001038433.1	1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase gamma-2
AAB87150.1	2',3'-cyclic-nucleotide 3'-phosphodiesterase gRICH70
NP_001076813.1	2,4-dienoyl CoA reductase 1, mitochondrial
ACO09743.1	2,4-dienoyl-CoA reductase, mitochondrial precursor
XP_001608924.1	200 kDa antigen p200
AFF60185.1	20beta-hydroxysteroid dehydrogenase
NP_001008645.1	24-dehydrocholesterol reductase
EKC29780.1	26S protease regulatory subunit 4
NP_035318.1	26S protease regulatory subunit 7
ACO09830.1	26S protease regulatory subunit 8
NP_001003832.1	26S protease regulatory subunit S10B
NP_957478.1	26S proteasome non-ATPase regulatory subunit 1
NP_001187332.1	26S proteasome non-ATPase regulatory subunit 13
NP_001077042.1	26S proteasome non-ATPase regulatory subunit 14
NP_956840.1	26S proteasome non-ATPase regulatory subunit 2
NP_001133516.1	26S proteasome non-ATPase regulatory subunit 3
NP_001002112.1	26S proteasome non-ATPase regulatory subunit 4
NP_956585.1	26S proteasome non-ATPase regulatory subunit 6
NP_001187812.1	26S proteasome non-ATPase regulatory subunit 8
NP_956504.1	28 kDa heat- and acid-stable phosphoprotein
BAB40960.1	28kDa-2 apolipoprotein
NP_001002485.1	28S ribosomal protein S15, mitochondrial
ACI66496.1	28S ribosomal protein S15, mitochondrial precursor
NP_001018395.1	28S ribosomal protein S17, mitochondrial
ACI66878.1	28S ribosomal protein S18b, mitochondrial precursor
NP_001074162.1	28S ribosomal protein S2, mitochondrial
NP_001002418.1	28S ribosomal protein S26, mitochondrial
NP_001003778.1	28S ribosomal protein S27, mitochondrial
NP_001082840.1	28S ribosomal protein S30, mitochondrial
ACI33498.1	28S ribosomal protein S31, mitochondrial precursor
NP_001165334.1	28S ribosomal protein S33, mitochondrial
NP_001070064.1	28S ribosomal protein S5, mitochondrial precursor
NP_001038921.1	28S ribosomal protein S6, mitochondrial
NP_001038861.1	28S ribosomal protein S9, mitochondrial

NP_001116095.1 2-acylglycerol O-acyltransferase 1
 ADO28307.1 2-amino-3-carboxymuconate-6-semialdehyde decarboxylase
 NP_001166025.1 2-amino-3-ketobutyrate coenzyme A ligase, mitochondrial
 ACI67339.1 2-amino-3-ketobutyrate coenzyme A ligase, mitochondrial precursor
 NP_998358.1 2-aminoethanethiol (cysteamine) dioxygenase b
 ACO13857.1 2-aminoethanethiol dioxygenase
 NP_001156671.1 2'-deoxynucleoside 5'-phosphate N-hydrolase 1
 NP_998250.1 2-hydroxyacyl-CoA lyase 1
 NP_001037790.1 2-hydroxyacylsphingosine 1-beta-galactosyltransferase precursor
 NP_001004541.1 2-methoxy-6-polyprenyl-1,4-benzoquinol methylase, mitochondrial precursor
 NP_001073641.1 2-oxo-4-hydroxy-4-carboxy-5-ureidoimidazole decarboxylase
 NP_955983.1 2-oxoglutarate and iron-dependent oxygenase domain-containing protein 1
 NP_001073538.1 2-oxoglutarate and iron-dependent oxygenase domain-containing protein 2

 CAX12676.1 novel protein similar to H.sapiens NSUN4, NOL1/NOP2/Sun domain family, member 4 (NSUN4, zgc:101708)
 CAP19487.1 novel protein similar to H.sapiens ral guanine nucleotide dissociation stimulator (zgc:77299)
 CAE30421.1 novel protein similar to human and mouse CpG binding protein (CGBP)
 CAE17640.1 novel protein similar to human and mouse kinase suppressor of ras (KSR)
 CAI20723.2 novel protein similar to human and mouse NIMA (never in mitosis gene a)-related kinase 1 (NEK1)
 CAQ14649.1 novel protein similar to human and mouse SKB1 homolog (S. pombe)
 CAQ15497.1 novel protein similar to human and mouse stereocilin (STRC)
 CAE30428.1 novel protein similar to human and rodent metabotropic glutamate receptors (GRM)
 CAQ13802.1 novel protein similar to human Ca2+ dependent activator protein for secretion (CADPS)
 CAQ15258.1 novel protein similar to human chromosome 14 open reading frame 115 (C14orf115)
 CAE30408.1 novel protein similar to human chromosome 4 open reading frame 1 (C4orf1)
 CAE48997.1 novel protein similar to human conserved protein (gene) telomeric to alpha globin cluster (CGTHBA)
 CAD43436.1 novel protein similar to human cystatin
 CAE30363.1 novel protein similar to human EGF LAG seven-pass G-type receptor 1 cadherin (CELSR1)
 CAD52123.1 novel protein similar to human growth arrest-specific protein 2 (GAS2)
 CAE17623.2 novel protein similar to human H326 protein
 CAD43427.1 novel protein similar to human intersectin (SH3 domain protein, ITSN1)
 CAD58772.1 novel protein similar to human isovaleryl Coenzyme A dehydrogenase (IVD)
 CAD60815.1 novel protein similar to human MCF.2 cell line derived transforming sequence (MCF2)
 CAE30366.1 novel protein similar to human non-muscle myosin, heavy polypeptide 10 (MYH10)
 CAE47767.1 novel protein similar to human oligophrenin 1 (OPHN1)
 CAD52124.1 novel protein similar to human polycystic kidney disease 2-like 1 (PKD2L1)
 CAD52120.1 novel protein similar to human procadherin 15 (PCDH15)
 CAQ14853.1 novel protein similar to human ring finger protein 123 (RNF123)
 CAD43460.1 novel protein similar to human signal transduction and activator of transcription 4 (STAT4)
 CAE17634.2 novel protein similar to human telomerase-associated protein 1 (TEP1)
 CAD60810.1 novel protein similar to human THO complex 2 (THOC2)
 CAD60685.2 novel protein similar to human titin (TTN)
 CAD43431.1 novel protein similar to human upstream binding transcription factor, RNA polymerase I (UBTF)
 CAD60650.1 novel protein similar to human voltage-dependent calcium channel L type, alpha 1D subunit (CACNA1D)
 CAD43424.2 novel protein similar to human voltage-gated L-type calcium channel subunit (lsl)
 CAQ13630.1 novel protein similar to inositol polyphosphate-4-phosphatase, type I (inpp4a)
 CAK04427.1 novel protein similar to laminin beta 1 (lamb1)
 CAH68844.1 novel protein similar to lectins
 CAH69071.1 novel protein similar to mouse and human mitochondrial ribosomal protein L46 (MRPL46)

CAK04233.1 novel protein similar to mouse and human Rho guanine nucleotide exchange factor (GEF) 17 (ARHGEF17)
 CAE49579.1 novel protein similar to mouse and rodent cholinergic receptor, nicotinic, alpha polypeptide 7 (CHRNA7)
 CAK05295.1 novel protein similar to mouse translin-associated factor X (Tsnax) interacting protein 1 (Tsnaxip1)
 CAP09621.1 novel protein similar to phosphatase and actin regulator 3 (PHACTR3, zgc:109967)
 CAQ15069.1 novel protein similar to sorting nexin 9 (snx9)
 CAI21099.1 novel protein similar to tyrosine hydroxylase (th)
 CAX13439.1 novel protein similar to vertebrate actin filament associated protein 1-like 1 (AFAP1L1, zgc:114084)
 CAK10842.1 novel protein similar to vertebrate adenosine deaminase, RNA-specific, B2 (ADARB2)
 CAN87940.1 novel protein similar to vertebrate ADP-ribosylation factor-like 15 (ARL15)
 CAK04164.1 novel protein similar to vertebrate aftiphilin protein (AFTIPHILIN)
 CAQ15179.1 novel protein similar to vertebrate Alstrom syndrome 1 (ALMS1)
 CAQ14854.1 novel protein similar to vertebrate amphoterin-induced gene and ORF 3 (AMIGO3)
 CAD43463.1 novel protein similar to vertebrate anaplastic lymphoma kinase (ALK) and leukocyte tyrosine kinase receptor precursor (LTK or TYK1)
 CAM56622.1 novel protein similar to vertebrate anillin, actin binding protein (scraps homolog, Drosophila) (ANLN)
 CAM56537.1 novel protein similar to vertebrate beta1,4-N-acetylgalactosaminyltransferases IV (Beta4GalNAc-T4)
 CAK10913.1 novel protein similar to vertebrate BTB (POZ) domain containing family
 CAK04987.1 novel protein similar to vertebrate calcitonin receptor (CALCR)
 CAQ15509.1 novel protein similar to vertebrate calcium channel, voltage-dependent, beta 4 subunit (CACNB4, zgc:136550)
 CAD43420.1 novel protein similar to vertebrate caldesmon 1 (CALD1)
 CAK11015.1 novel protein similar to vertebrate cathepsin L (CTSL)
 CAQ13805.1 novel protein similar to vertebrate chemokine (C-X-C motif) receptor 3 (CXCR3)
 CAM15629.1 novel protein similar to vertebrate chloride intracellular channel 4 (CLIC4) (zgc:77538)
 CAQ14219.1 novel protein similar to vertebrate cholecystokinin receptor
 CAK04565.1 novel protein similar to vertebrate chromosome 6 open reading frame 31 (C6orf31)
 CAK05003.1 novel protein similar to vertebrate chromosome 6 open reading frame 32 (C6orf32)
 CAQ13355.1 novel protein similar to vertebrate complement component 3 (C3)
 CAM14211.1 novel protein similar to vertebrate cyclin L1 (CCNL1)
 CAQ13700.1 novel protein similar to vertebrate cysteine-rich, angiogenic inducer, 61 (CYR61)
 CAN88410.1 novel protein similar to vertebrate DAB2 interacting protein (DAB2IP)
 CAK04442.1 novel protein similar to vertebrate discs, large homolog 3 (neuroendocrine-dlg, Drosophila) (DLG3)
 CAQ15104.1 novel protein similar to vertebrate ectonucleoside triphosphate diphosphohydrolase 6 (putative function) (ENTPD6)
 CAK04263.1 novel protein similar to vertebrate Eph receptor A7 (EPHA7)
 CAP19482.1 novel protein similar to vertebrate ER degradation enhancer, mannosidase alpha-like 3 (EDEM3)
 CAQ15527.1 novel protein similar to vertebrate F-box and leucine-rich repeat protein 4 (FBXL4)
 CAM15224.1 novel protein similar to vertebrate fer (fps/fes related) tyrosine kinase (phosphoprotein NCP94) (FER)
 CAM56556.1 novel protein similar to vertebrate FK506 binding protein 10, 65 kDa (FKBP10)
 CAI11956.2 novel protein similar to vertebrate formyltetrahydrofolate synthetase domain containing 1 (FTHFSDC1)
 CAQ15495.1 novel protein similar to vertebrate furin (paired basic amino acid cleaving enzyme) (FURIN)
 CAK04056.1 novel protein similar to vertebrate gamma-aminobutyric acid (GABA) B receptor, 1 (GABBR1)
 CAN88734.1 novel protein similar to vertebrate heat shock 27kDa protein 3 (HSPB3)
 CAM16013.1 novel protein similar to vertebrate hexosaminidase A (alpha polypeptide) (HEXA)
 CAK10783.1 novel protein similar to vertebrate homeodomain interacting protein kinase 1 (HIPK1)
 CAK03700.1 novel protein similar to vertebrate importin 8 (IPO8)
 CAK04779.1 novel protein similar to vertebrate importin family
 CAK05352.1 novel protein similar to vertebrate inositol 1,4,5-triphosphate receptor, type 2 (ITPR2)
 CAM46908.1 novel protein similar to vertebrate intersectin (SH3 domain protein)
 CAM46910.1 novel protein similar to vertebrate laminin EGF-like (Domains III and V) family
 CAK04984.1 novel protein similar to vertebrate leprecan-like family
 CAQ13698.1 novel protein similar to vertebrate leucine rich repeat containing 8 family
 CAM56333.1 novel protein similar to vertebrate mannosyl (alpha-1,3-)-glycoprotein beta-1,2-N-acetylglucosaminyltransferase (MGAT1)
 CAX14015.1 novel protein similar to vertebrate MAP/microtubule affinity-regulating kinase 3 (MARK3, zgc:153725)
 CAK05316.1 novel protein similar to vertebrate mitogen-activated protein kinase 8 interacting protein 2 (MAPK8IP2)
 CAM46906.1 novel protein similar to vertebrate monooxygenase, DBH-like 1 (MOXD1)
 CAK10917.1 novel protein similar to vertebrate myosin 5 family
 CAK11237.1 novel protein similar to vertebrate nebulin (NEB)
 CAN88735.1 novel protein similar to vertebrate nephronophthisis 4 (NPHP4)
 CAK10957.1 novel protein similar to vertebrate nuclear factor, interleukin 3 regulated (NFIL3)
 CAM13426.1 novel protein similar to vertebrate nuclear receptor subfamily 3, group C, member 2 (NR3C2)
 CAQ14846.1 novel protein similar to vertebrate nuclear transcription factor Y, alpha (NFYA)
 CAX12847.1 novel protein similar to vertebrate odz, odd Oz/ten-m homolog 2 (Drosophila) (ODZ2)
 CAM56632.1 novel protein similar to vertebrate outer dense fiber of sperm tails 3 (ODF3) (zgc:63985)
 CAK05293.1 novel protein similar to vertebrate par-6 partitioning defective 6 homolog (C.elegans) family
 CAI20814.2 novel protein similar to vertebrate PCTAIRE protein kinase 2 (PCTK2)
 CAM56444.1 novel protein similar to vertebrate pentaxin-related gene, rapidly induced by IL-1 beta (PTX3)
 CAQ13359.1 novel protein similar to vertebrate persephin (PSPN)
 CAQ15253.1 novel protein similar to vertebrate phosphatidylinositol binding clathrin assembly protein (PICALM)
 CAK10742.1 novel protein similar to vertebrate phospholipase A2, group VI (PLA2G6) (zgc:77476)
 CAQ13264.1 novel protein similar to vertebrate phospholipase C-like 3 (PLCL3)
 CAI11876.1 novel protein similar to vertebrate protein kinase lysine deficient 1 (PRKWNK1)
 CAM14100.1 novel protein similar to vertebrate RAB6 interacting protein 2 (RAB6IP2)
 CAQ15481.1 novel protein similar to vertebrate ring finger and WD repeat domain 2 (RFWD2, zgc:163067)
 CAK04313.1 novel protein similar to vertebrate scinderin (SCIN)
 CAI12052.1 novel protein similar to vertebrate SH3 multiple domains 2 (SH3MD2)
 CAK04781.1 novel protein similar to vertebrate SLIT-ROBO Rho GTPase activating protein family
 CAX12842.1 novel protein similar to vertebrate sorbin and SH3 domain containing 2 (SORBS2)
 CAH68877.2 novel protein similar to vertebrate spectrin repeat containing, nuclear envelope 1 (SYNE1)
 CAM56615.1 novel protein similar to vertebrate SUMO1/sentrin specific protease family
 CAQ13812.1 novel protein similar to vertebrate titin (TTN)
 CAK05007.1 novel protein similar to vertebrate TRAF and TNF receptor associated protein (TTRAP)

CAM56558.1 novel protein similar to vertebrate vacuolar protein sorting 52 (yeast) (VSP52)
 CAM56332.1 novel protein similar to vertebrate valyl-tRNA synthetase 2-like (VAR52L)
 CAQ13815.1 novel protein similar to vertebrate vasodilator-stimulated phosphoprotein (VASP)
 CAE50430.1 novel protein similar to vertebrate voltage-dependent calcium channel P/Q type alpha 1 subunit (CACNA1)
 CAK10892.1 novel protein similar to vertebrate zinc finger protein 384 (ZNF384)
 CAE30437.1 novel protein similar to zebrafish epithelial cadherin 1 (cdh1)
 CAD24437.2 novel protein similar to zinc finger proteins

AAG22081.1	14-3-3.a protein
AAG24880.1	connexin 44.2
AAK28043.1	transmembrane receptor Roundabout3
AAL54865.1	CCAAT/enhancer binding protein beta
AAG30275.1	Na+/K+ ATPase alpha subunit isoform 5
AAG40860.1	Kv3.3 potassium channel subunit precursor
AAK01923.1	nonspecific cytotoxic cell receptor protein
AAG53683.1	MHC class I heavy chain partial
AAK15300.1	receptor tyrosine kinase Fms
AAG46038.1	T cell receptor beta chain VDJC
AAM95605.1	gonadotropin-releasing hormone receptor 2
AAK58426.1	roundabout1
AAK52474.1	Rho GTPase-activating protein
AAK27699.1	Gli2

AAK69693.1	glypican Knypek
AAK58879.1	putative reverse transcriptase
AAK27722.1	sodium/potassium pump alpha subunit
AAL01836.1	claudin 11
AAL24467.1	UDP-glucose dehydrogenase
AAK52503.1	AMPA glutamate receptor subunit 1a short Flop isoform
AAL13229.1	AMPA receptor subunit 2b
AAL13230.1	AMPA receptor subunit 2a
AAK95589.1	IGHM enhancer 3a-binding transcription factor
AAK51970.1	cer-d4 XZ isoform
AAL04486.1	transcription factor Nkx5-2
AAK52836.1	G-protein beta 5
AAK53436.1	prolactin hormone
AAK51558.1	preproinsulin
AAK64495.1	amyloid precursor protein
AAK91291.1	atypical protein kinase C lambda
AAK76993.1	kruppel-like factor 4
AAK83380.1	smoothened
AAL26325.1	alcohol dehydrogenase
AAM45766.1	basic immunoglobulin-like variable motif-containing protein
AAL89660.1	SRm160/300 splicing coactivator partial
AAL04169.1	mismatch repair protein Msh2
AAL04170.1	mismatch repair protein Msh6
AAL11906.1	ikaros
AAN76663.2	P100-like protein short variant
AAL79825.1	DachshundC
AAQ04554.1	DMRT1
AAL32047.1	Xiap
AAL50804.1	GABAA receptor gamma2 subunit
AAN75698.1	SE2-5L16 protein
AAN87556.1	PDGFRalpha isoform 2
AAM21009.1	QKI isoform D KH
AAP68899.1	somatostatin receptor type five subtype C
AAL87140.1	DEAD box RNA helicase Vasa
AAM18478.1	VHSV-induced protein partial
AAO49408.1	elongation factor 1-alpha
AAM76920.1	protein kinase RICK
AAM00910.1	glycine receptor alphaZIL subunit
AAM22227.1	adipose glucose transporter
AAM34658.1	vesicular integral-membrane protein VIP36-like protein
AAM34664.1	valyl-tRNA synthetase
AAM34687.1	transcription factor Tcf4 variant S9
AAM44059.1	lunatic fringe protein
AAO65847.1	class IIIB myosin short isoform
AAM55226.1	CA protein
Q7ZW00.2	Acylglycerol kinase, mitochondrial
Q6NYL5.2	Alanine aminotransferase 2-like
P53448.2	Fructose-bisphosphate aldolase
Q7ZW24.2	GDP-Man:Man(3)GlcNAc(2)-PP-Dol alpha-1,2-mannosyltransferase
A1YB07.2	Angiotensin-like 2a
Q5RGQ2.2	Protein arginine N-methyltransferase 8-B
P55202.1	Atrial natriuretic peptide receptor 2
Q5RJ20.1	Transcription factor AP-2-delta
A0MTA1.1	DNA-(apurinic or apyrimidinic site) lyase
Q9DG12.2	Aryl hydrocarbon receptor nuclear translocator 2
P51466.1	Arrestin red cell isoform 1
Q6PH17.1	Alpha-tubulin N-acetyltransferase
Q6DG88.2	Cysteine protease ATG4B
F1Q4S1.1	Probable phospholipid-transporting ATPase IIB
Q9PTY0.1	ATP synthase subunit beta, mitochondrial
Q6AXK4.2	BRISC and BRCA1-A complex member 1
A3KPW9.1	Large proline-rich protein BAG6
A1L2G3.2	Ubiquitin carboxyl-terminal hydrolase BAP1
A2BIL7.2	Tyrosine-protein kinase BAZ1B
A2BIL8.1	B-cell CLL/lymphoma 7 protein family member B-B
Q5XFY4.1	B-cell CLL/lymphoma 7 protein family member A
Q32LQ4.1	Betaine-homocysteine S-methyltransferase 1
P0CF95.1	Bicaudal D-related protein 1
Q90WT7.1	Bladder cancer-associated protein
F1QW93.2	Bromodomain testis-specific protein
A8KBY2.1	Transcription factor IIIB 50 kDa subunit
Q1LVW0.2	Ankyrin repeat and BTB/POZ domain-containing protein BTBD11-A
P0C7A6.1	Ankyrin repeat and BTB/POZ domain-containing protein BTBD11-B
Q567Z7.1	Protein BUD31 homolog
Q1LUC1.1	Basic leucine zipper and W2 domain-containing protein 2
P0C7U4.1	C3a anaphylatoxin chemotactic receptor
Q5M7Y0.2	Collagen type IV alpha-3-binding protein
Q5TYP4.1	Uncharacterized protein C1orf112 homolog
Q99244.2	Voltage-dependent L-type calcium channel subunit alpha-1D

P22316.1 Dihydropyridine-sensitive L-type skeletal muscle calcium channel subunit alpha-1
Q8AXU4.1 Calcitonin gene-related peptide type 1 receptor
B5X186.1 Calumenin-A
A6H8T2.2 Cancer susceptibility candidate protein 1 homolog
Q1ECZ4.1 Protein CASC3
Q5RFV8.2 WD repeat-containing protein C2orf44 homolog
Q66I85.1 Coiled-coil domain-containing protein 130 homolog
P0CK98.1 Coiled-coil domain-containing protein 39
A7MC22.2 Coiled-coil domain-containing protein 69
Q1LX29.2 Coiled-coil domain-containing protein 79
Q92161.1 Cyclin-A1
Q60FX9.1 G2/mitotic-specific cyclin-B2
Q90304.2 CD166 antigen homolog
A7YY97.1 Hsp90 co-chaperone Cdc37-like 1
Q9DGQ7.1 Hsp90 co-chaperone Cdc37
A8WIP6.1 Cyclin-dependent kinase 20
Q6NZT2.2 Cerebellar degeneration-related protein 2-like
P85001.1 Centrosomal protein of 290 kDa
Q1LV50.1 Centromere protein P
Q6PGZ0.2 Centrosomal protein of 63 kDa
Q501X2.2 Centrosomal protein of 72 kDa
Q7ZTY6.2 Uncharacterized protein C7orf26 homolog
B0R0I6.2 Chromodomain-helicase-DNA-binding protein 8
Q6DBY9.2 Carbohydrate sulfotransferase 1
B5X9P2.1 Probable cytosolic iron-sulfur protein assembly protein ciao1-A
Q6DEL2.1 Cleft lip and palate transmembrane protein 1 homolog
Q7ZVC2.2 Clusterin-associated protein 1 homolog
P55934.1 Cyclic nucleotide-gated cation channel
A2BHJ4.1 CCR4-NOT transcription complex subunit 6-like
Q8AXZ4.1 Contactin-1a
F1R983.1 DNA endonuclease RBBP8
A2BE76.1 UPF0472 protein C16orf72 homolog
Q92111.1 Cytochrome P450 19A1
Q6EIG3.1 Cytochrome P450 26B1
Q92088.1 Cytochrome P450 2M1
Q9YGX5.1 Cytoplasmic polyadenylation element-binding protein 1
Q5U3U3.2 Carnitine O-palmitoyltransferase 2, mitochondrial
Q1LYG4.2 Cyclic AMP-responsive element-binding protein 3-like protein 3-B
P10I12.3 Beta-crystallin S
Q7SXF6.2 Cysteine-rich with EGF-like domain protein 2
Q568M3.1 Cytokine receptor-like factor 3
O93591.1 Alpha-crystallin A chain
Q6P2U9.1 COP9 signalosome complex subunit 3
P06914.1 Circumsporozoite protein
A5PMW0.1 Choline transporter-like protein 5-A
Q92052.1 Gap junction gamma-1 protein
A8DZE7.1 Short-chain dehydrogenase/reductase family 42E member 1
A0JML8.1 DALR anticodon-binding domain-containing protein 3
B0V2S2.1 5' exonuclease Apollo
P0C218.1 Probable ATP-dependent RNA helicase DDX20
Q8JHJ2.2 ATP-dependent RNA helicase DDX55
Q6NXD8.2 DENN domain-containing protein 5B
Q6PEH4.2 Digestive organ expansion factor
Q6DI48.1 Delta-like protein A
Q8UWJ4.2 Delta-like protein D
Q01702.1 Homeobox protein Dlx3b
Q4A3R3.1 Deleted in malignant brain tumors 1 protein
B5X216.1 Draxin-A
A8E5C5.1 Dehydrogenase/reductase SDR family member 7C-A
Q5RHI5.1 Denticleless protein homolog
Q5XJ56.1 DTW domain-containing protein 1
P0C599.1 Dual specificity phosphatase DUPD1
Q4VSN1.1 Dual serine/threonine and tyrosine protein kinase
Q63164.2 Dynein heavy chain 1, axonemal
Q7T019.2 Zinc finger protein Dzip1
F1R6N4.2 Ethylmalonyl-CoA decarboxylase
Q08CK1.1 Evolutionarily conserved signaling intermediate in Toll pathway, mitochondrial
Q566T0.2 Polycomb protein eed
Q90YC0.1 Elongation factor 1-gamma
Q32TF8.2 EF-hand domain-containing family member C2
Q5SPP5.2 Protein EFR3 homolog B
Q6TH15.1 Eukaryotic translation initiation factor 3 subunit D
Q6DRC4.1 Eukaryotic translation initiation factor 3 subunit G
Q05AM5.1 Elongator complex protein 2
Q566Y1.2 Elongator complex protein 4
A7E2M3.1 ER membrane protein complex subunit 10
A1L251.1 Cytosolic endo-beta-N-acetylglucosaminidase
Q91736.1 Ephrin type-B receptor 1-B
O13147.1 Ephrin type-B receptor 3

Q99KN9.2	Clathrin interactor 1
Q5SPR8.1	N-acetyltransferase ESCO2
Q7ZVR8.2	Epithelial splicing regulatory protein 2
A2AV37.1	Exocyst complex component 3-like protein
Q502K1.2	Nuclease EXOG, mitochondrial
Q5IGR8.1	Exostosin-1a
Q7T297.2	Protein FAM172A
Q1LWH4.2	Fanconi-associated nuclease 1
Q2YDQ5.2	F-box/LRR-repeat protein 5
E7FBF7.2	FCH domain only protein 1
Q6TNU4.1	Flap endonuclease 1
Q25434.1	Adhesive plaque matrix protein
E6ZJH8.1	F-box/LRR-repeat protein 15
B0UXS1.1	FAD-dependent oxidoreductase domain-containing protein 2
Q6EWH2.2	Tyrosine-protein kinase fyn
F1RDG9.1	Tyrosine-protein kinase fynb
Q5SNX7.1	Galactocerebrosidase
Q6P963.2	Hydroxyacylglutathione hydrolase, mitochondrial
A0JPE9.1	Putative glycerol kinase 5
O42329.2	Gonadotropin-releasing hormone II receptor
P43306.1	Progonadoliberin-2
P50593.1	Glypican-1
F1QCC6.1	Glypican-1: RecName: Full
Q9PW88.1	G-protein coupled receptor family C group 6 member A
P18266.1	Glycogen synthase kinase-3 beta
Q568B7.2	Glycosyltransferase-like domain-containing protein 1
Q800H9.2	Heparan-sulfate 6-O-sulfotransferase 2
F8W2M1.2	E3 ubiquitin-protein ligase HACE1
P82316.1	Hemoglobin cathodic subunit beta
Q6NYI0.1	Homocysteine-responsive endoplasmic reticulum-resident ubiquitin-like domain member 2 protein
Q8AXV5.2	Hairy/enhancer-of-split related with YRPW motif-like protein
Q90W33.1	Hypermethylated in cancer 2 protein
P59723.2	Hypoxia-inducible factor 1-alpha inhibitor
Q06S87.1	5-hydroxyisourate hydrolase
Q504H8.1	Homeobox protein HMX3
A1LIN5.2	Hepatocyte nuclear factor 1-beta-A
Q56A36.1	Hematopoietic SH2 domain-containing protein homolog
E1C2P3.1	Heat shock 70 kDa protein 14

 Q04202.1 Transposable element Tcb2 transposase
 Q58EK5.2 Tudor domain-containing protein 1
 Q7T006.2 Telomere length regulation protein TEL2 homolog
 Q803M3.2 Testis-expressed sequence 10 protein homolog
 Q9PTQ2.1 Transforming growth factor beta-1
 P52181.1 Protein-glutamine gamma-glutamyltransferase 2
 A5PF62.1 Protein THEMIS
 B3DH20.1 Protein tilB homolog
 Q7T2P6.1 Mitochondrial import inner membrane translocase subunit Tim23
 P25421.2 Protachykinin
 Q1LWV7.1 TLD domain-containing protein 1
 E7EYQ9.1 Transmembrane protein 216
 Q7F316.2 Transmembrane protein 231
 Q6NWH5.1 Transmembrane protein 11, mitochondrial
 Q7ZV43.1 Toll-interacting protein
 Q1RLX4.1 Trafficking protein particle complex subunit 11
 Q1MTI4.1 Triosephosphate isomerase A
 Q90XG0.1 Triosephosphate isomerase B
 A6NAF9.2 Tudor domain-containing protein 7A
 E7FDW8.2 Tudor domain-containing protein 7B
 Q6E2N3.1 E3 ubiquitin-protein ligase TRIM33
 Q1LUA6.1 Triple functional domain protein
 F1RCR6.1 E3 ubiquitin-protein ligase TRIP12
 Q3KRG3.1 Pre-rRNA-processing protein TSR2 homolog
 Q1LXE6.1 Tetratricopeptide repeat protein 39C
 A4QP73.2 Tetratricopeptide repeat protein 19, mitochondrial
 Q8AYG3.2 Dual specificity protein kinase Ttk
 Q90419.1 Tiggy-winkle hedgehog protein
 Q1LWB0.2 Tax1-binding protein 1 homolog A
 Q6P132.3 Tax1-binding protein 1 homolog B
 C1BHN7.1 Ubiquitin-like protein 4A-B
 F6Z5C0.2 Ubiquitin carboxyl-terminal hydrolase 15
 A5PN09.1 Ubiquitin carboxyl-terminal hydrolase 20
 A5PMR2.1 Ubiquitin carboxyl-terminal hydrolase 33
 E7F6T8.1 Ubiquitin carboxyl-terminal hydrolase 37
 P70398.2 Probable ubiquitin carboxyl-terminal hydrolase FAF-X
 P04560.1 Prepro-urotensin II-alpha
 Q5GIT4.2 Vascular endothelial growth factor receptor 2
 Q90308.1 Vasoactive intestinal polypeptide receptor
 A4IG59.2 WAS protein family homolog 1
 Q6NX08.1 Ribosome biogenesis protein wdr12
 Q6TEN6.2 WD repeat-containing protein 91
 P51028.2 Protein Wnt-8a
 Q1L8W0.1 Zinc finger and BTB domain-containing protein 18
 Q5TYQ8.1 Zinc finger CCCH domain-containing protein 14
 Q6PCR6.2 Zinc finger RNA-binding protein
 Q1LYE3.2 Zinc finger protein 143
 Q6UFS5.1 Zinc finger protein 503
 P0C7X5.1 Zinc finger protein 806
 1B5M at Outer Mitochondrial Membrane Cytochrome B5
 1BR2 mooth Muscle Myosin Motor Domain Complexed With Mgadp.Alf4
 1CXZ rystal Structure Of Human Rhoa Complexed With The Effector Domain Of The Protein Kinase PknPRK1
 1EGX hain ? , Solution Structure Of The Ena-Vasp Homology 1 (Evh1) Domain Of Human Vasodilator-Stimulated Phosphoprotein (Vasp)
 1EJ1 Cocystal Structure Of The Messenger Rna 5' Cap-Binding Protein (Eif4e) Bound To 7-Methyl-Gdp
 1GWN he Crystal Structure Of The Core Domain Of RhoerND3 - A Constitutively Activated Small G Protein
 1HL3 hain ? , CtpbBARS IN TERNARY COMPLEX WITH NAD(H) AND PIDLSKK PEPTIDE
 1J19 hain ? , Crystal Structure Of The Radxin Ferm Domain Complexed With The Icam-2 Cytoplasmic Peptide
 1MR1 hain ? , Crystal Structure Of A Smad4-Ski Complex
 1O91 hain ? , Crystal Structure Of A Collagen Viii Nc1 Domain Trimer
 1OE9 hain ? , Crystal Structure Of Myosin V Motor With Essential Light Chain - Nucleotide-Free
 1Q30 hain ? , Crystal Structure Of The Shank Pdz-ligand Complex Reveals A Class I Pdz Interaction And A Novel Pdz-pdz Dimerization
 1U5Q hain ? , Crystal Structure Of The Tao2 Kinase Domain: Activation And Specificity Of A Ste20p Map3k
 1V6A hain ? , Crystal Structure Of L-Lactate Dehydrogenase From Cyprinus Carpio
 1WG6 hain A, Solution Structure Of Pdz Domain In Protein Xp_110852
 1Z31 hain X, Structure Of The Swi2SNF2 CHROMATIN REMODELING DOMAIN OF EUKARYOTIC Rad54
 1ZSX hain A, Crystal Structure Of Human Potassium Channel Kv Beta-Subunit (Kcnab2)
 2CL3 hain A, Crystal Structure Of Human Cleavage And Polyadenylation Specificity Factor 5 (Cps5)
 2F57 hain B, Crystal Structure Of The Human P21-activated Kinase 5

2GCD hain B, Tao2 Kinase Domain-Staurosporine Structure
2GCO hain B, Crystal Structure Of The Human Rhoc-gppnhp Complex
2I38 hain A, Solution Structure Of The Rrm Of Srp20
2I3E hain A, Solution Structure Of Catalytic Domain Of Goldfish Rich Protein
2J0J hain A, Crystal Structure Of A Fragment Of Focal Adhesion Kinase Containing The Ferm And Kinase Domains.
2LEA hain A, Solution Structure Of Human Srsf2 (Sc35) Rrm
2O3C hain C, Crystal Structure Of Zebrafish Ape
2V7O hain A, Crystal Structure Of Human Calcium-Calmodulin-Dependent Protein Kinase Ii Gamma
2WD5 hain B, Smc Hinge Heterodimer
2WJV hain ? , Crystal Structure Of The Complex Between Human Nonsense Mediated Decay Factors Upf1 And Upf2
3CC0 hain ? , The Dvl2 PdZ Domain In Complex With The N3 Inhibitory Peptide
3CQU hain ? , Crystal Structure Of Akt-1 Complexed With Substrate Peptide And Inhibitor
3EH1 hain A, Crystal Structure Of The Human Copii-Coat Protein Sec24b
3EH2 hain C, Crystal Structure Of The Human Copii-Coat Protein Sec24c
3F5F hain A, Crystal Structure Of Heparan Sulfate 2-O-Sulfotransferase From Gallus Gallus As A Maltose Binding Protein Fusion.
3FXZ hain A, Crystal Structure Of Pak1 Kinase Domain With Ruthenium Complex Lambda-F172
3LJE hain A, The X-Ray Structure Of Zebrafish Rnase5
3MLP hain ? , Early B-Cell Factor 1 (Ebf1) Bound To Dna
3QI3 hain ? , The Structure Of The Ca2+-Binding, Glycosylated F-Spondin Domain Of F- Spondin, A C2-Domain Variant From Extracellular Matrix
3QA8 hain ? , Crystal Structure Of Inhibitor Of Kappa B Kinase Beta
3QCW hain B, Structure Of Neurexin 1 Alpha (Domains Lns1-Lns6), No Splice Inserts
3TAC hain ? , Crystal Structure Of The Liprin-AlphaCASK COMPLEX
3TZM hain A, Tgf-Beta Receptor Type 1 In Complex With Sb431542
4ACJ hain A, Crystal Structure Of The Tide Domain Of Oxidation Resistance Protein 2 From Zebrafish
4DDG hain ? , Crystal Structure Of Human Otub1UBCH5B-UBUB
4DRZ hain A, Crystal Structure Of Human Rab14
4I5I hain ? , Crystal Structure Of The Sirt1 Catalytic Domain Bound To Nad And An Ex527 Analog
AGC24229.1 lipoprotein lipase, partial

 XP_002157404.1 similar to zinc finger, MYM domain containing 1
 XP_002157459.1 similar to copia-type polyprotein, putative
 XP_002158140.1 similar to SJCHGC09533 protein
 XP_002158976.1 similar to hCG32740
 XP_002159150.1 similar to Tc1-like transposase
 XP_002160127.1 similar to GI20863
 XP_002160419.1 similar to reverse transcriptase-like protein
 XP_002161149.1 similar to Receptor-type tyrosine-protein phosphatase kappa
 XP_002161415.1 similar to proline-rich protein
 XP_002162448.1 similar to transposase homolog
 XP_002162994.1 similar to GF20795, partial
 XP_002164402.1 similar to zinc finger protein
 XP_002165847.1 similar to conserved hypothetical protein, partial
 XP_002166215.1 similar to copia-type polyprotein, putative, partial
 XP_002166584.1 similar to harbinger transposase derived 1
 XP_002166794.1 similar to protein-tyrosine phosphatase CRYPalph1
 XP_002168437.1 similar to GG25361, partial
 XP_002168451.1 similar to brix domain containing 5
 XP_002168771.1 similar to zinc finger, H2C2 domain containing, partial
 XP_002168777.1 similar to tyrosine kinase receptor, partial
 XP_002168999.1 similar to protein kinase, DNA activated, catalytic polypeptide
 XP_002169404.1 similar to Tcb2
 XP_002170731.1 similar to hCG32740, partial
 XP_002186706.1 similar to thioredoxin domain containing 10
 XP_002186911.1 similar to brain-specific angiogenesis inhibitor 1
 XP_002186947.1 similar to centrosomal protein 2
 XP_002186969.1 similar to LOC779495 protein
 XP_002187041.1 protein phosphatase 1, catalytic subunit, beta isoform
 XP_002187174.1 histidine acid phosphatase domain containing 1
 XP_002187303.1 protein tyrosine phosphatase, receptor type, f polypeptide (PTPRF), interacting protein (liprin), alpha 1
 XP_002187328.1 similar to Adhesive plaque matrix protein, partial
 XP_002187391.1 similar to TEF-1 gamma
 XP_002187453.1 similar to Rab geranylgeranyltransferase, beta subunit
 XP_002187570.1 receptor accessory protein 3
 XP_002187595.1 copine VIII
 XP_002187667.1 thrombospondin 4
 XP_002187894.1 ATPase, H+ transporting, lysosomal 56/58kDa, V1 subunit B2
 XP_002187924.1 similar to C22orf9 protein
 XP_002188036.1 ankyrin repeat domain 13C
 XP_002188037.1 similar to KIAA0669 protein

XP_002188137.1 quaking homolog, KH domain RNA binding
 XP_002188213.1 SLIT-ROBO Rho GTPase activating protein 1
 XP_002188500.1 similar to Snx17 protein
 XP_002188507.1 basic leucine zipper and W2 domains 2, partial
 XP_002188623.1 similar to ADAM metallopeptidase with thrombospondin type 1 motif, 19
 XP_002188773.1 similar to Pol polyprotein
 XP_002188870.1 similar to hCG2036582
 XP_002189018.1 similar to receptor-interacting serine-threonine kinase 2
 XP_002189021.1 similar to Long-chain-fatty-acid--CoA ligase 6 (Long-chain acyl-CoA synthetase 6) (LACS 6)
 XP_002189196.1 poly (ADP-ribose) polymerase family, member 14
 XP_002189248.1 sulfatase 2 isoform 2
 XP_002189335.1 similar to deleted in malignant brain tumors 1
 XP_002189346.1 gamma-aminobutyric acid (GABA) A receptor, gamma 2
 XP_002189513.1 similar to catenin (cadherin-associated protein), alpha-like 1
 XP_002189691.1 similar to hepatitis B virus x associated protein
 XP_002189855.1 similar to protein phosphatase 2 (formerly 2A), regulatory subunit B (PR 52), beta isoform
 XP_002190072.1 programmed cell death 6
 XP_002190144.1 ecotropic viral integration site 5
 XP_002190258.1 guanine nucleotide binding protein (G protein), alpha activating activity polypeptide O isoform 3
 XP_002190297.1 ORAI calcium release-activated calcium modulator 1
 XP_002190315.1 similar to Dedicator of cytokinesis 1
 XP_002190384.1 similar to myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, Drosophila); translocated to, 3
 XP_002190413.1 similar to selectin L
 XP_002190414.1 similar to RUN and SH3 domain containing 2
 XP_002190510.1 similar to calcium/calmodulin-dependent serine protein kinase (MAGUK family)
 XP_002190820.1 ADAMTS-like 1
 XP_002190836.1 similar to protein phosphatase 2 (formerly 2A), regulatory subunit B (PR 52), alpha isoform
 XP_002190982.1 similar to KIAA1768, partial
 XP_002191008.1 similar to zyg12
 XP_002191033.1 splicing factor 3b, subunit 4, 49kDa
 XP_002191039.1 G protein-coupled receptor 123
 XP_002191068.1 striatin, calmodulin binding protein
 XP_002191196.1 prostaglandin F2 receptor negative regulator
 XP_002191460.1 similar to unc-84 homolog A (C. elegans)
 XP_002191623.1 latent transforming growth factor beta binding protein 1
 XP_002191933.1 nuclear distribution gene C homolog
 XP_002192043.1 similar to adenylate cyclase 1, partial
 XP_002192120.1 similar to deleted in liver cancer 1
 XP_002192169.1 similar to fibulin 2
 XP_002192188.1 transmembrane anterior posterior transformation 1
 XP_002192216.1 similar to spacemaker
 XP_002192425.1 LIM and senescent cell antigen-like domains 1
 XP_002192480.1 GRIP and coiled-coil domain containing 2
 XP_002192618.1 similar to hCG2039627
 XP_002192650.1 5-hydroxytryptamine (serotonin) receptor 4
 XP_002192685.1 calcium channel, voltage-dependent, L type, alpha 1D subunit
 XP_002192748.1 similar to type IV alpha 6 collagen
 XP_002192770.1 ryanodine receptor 2 (cardiac)
 XP_002192776.1 synaptotagmin IX
 XP_002192891.1 similar to type XXVI collagen
 XP_002193041.1 similar to transcription factor 25 (basic helix-loop-helix)
 XP_002193095.1 metastasis associated 1 family, member 3
 XP_002193183.1 similar to Tetratricopeptide repeat domain 39A
 XP_002193235.1 similar to myosin IXA
 XP_002193242.1 solute carrier family 37 (glycerol-3-phosphate transporter), member 2
 XP_002193361.1 similar to MGC68650 protein
 XP_002193370.1 similar to hCG1657150
 XP_002193405.1 adenylate cyclase activating polypeptide 1 (pituitary) receptor type I
 XP_002193548.1 similar to cyclin M2
 XP_002193590.1 nucleolar protein family A, member 2 (H/ACA small nucleolar RNPs)
 XP_002193760.1 similar to phospholipase D1
 XP_002193887.1 transmembrane 9 superfamily member 3
 XP_002193921.1 similar to MGC81609 protein
 XP_002193929.1 similar to unc-51-like kinase 2, partial
 XP_002193989.1 similar to Serine/threonine-protein kinase DCLK1
 XP_002194204.1 similar to coiled-coil domain containing 46
 XP_002194308.1 similar to gsg1-like
 XP_002194486.1 similar to complement component 4 binding protein, alpha chain
 XP_002194530.1 TSC22 domain family, member 3
 XP_002194552.1 enabled homolog
 XP_002194616.1 GCN5 general control of amino-acid synthesis 5-like 2
 XP_002194694.1 gamma-aminobutyric acid (GABA) A receptor, beta 3
 XP_002194942.1 similar to CDC42 binding protein kinase alpha (DMPK-like)
 XP_002194974.1 similar to polypeptide N-acetylgalactosaminyltransferase 10
 XP_002195153.1 l(3)mbt-like 2
 XP_002195178.1 similar to Protein Dok-7
 XP_002195216.1 transcription factor IIB
 XP_002195273.1 armadillo repeat gene deletes in velocardiofacial syndrome
 XP_002195291.1 splicing factor, arginine/serine-rich 17A

XP_002195379.1 similar to polyprotein
 XP_002195408.1 similar to transcription factor Dp-2 (E2F dimerization partner 2)
 XP_002195592.1 similar to yippee-like 1
 XP_002195650.1 eukaryotic translation elongation factor 2
 XP_002195789.1 similar to RAN binding protein 10
 XP_002195934.1 similar to pol protein, partial
 XP_002195952.1 potassium large conductance calcium-activated channel, subfamily M, alpha member 1 isoform 3
 XP_002196019.1 magnesium transporter 1
 XP_002196058.1 axin 1
 XP_002196099.1 homer homolog 3 (Drosophila)
 XP_002196131.1 similar to Leucine-rich repeat-containing protein 16C
 XP_002196183.1 similar to Gag-Pol polyprotein
 XP_002196203.1 regulator of G-protein signalling 7
 XP_002196255.1 similar to cleavage and polyadenylation specific factor 3, 73kDa
 XP_002196263.1 vacuolar protein sorting 53
 XP_002196305.1 similar to double C2-like domains, beta
 XP_002196365.1 similar to RIKEN cDNA 6330505N24
 XP_002196738.1 similar to rCG60573
 XP_002196781.1 similar to isovaleryl Coenzyme A dehydrogenase
 XP_002197072.1 polymerase (DNA-directed), delta interacting protein 3
 XP_002197106.1 odz, odd Oz/ten-m homolog 1(Drosophila) isoform 1
 XP_002197176.1 Bardet-Biedl syndrome 9
 XP_002197430.1 similar to SLAIN motif-containing protein 1
 XP_002197821.1 similar to Usher syndrome 1C homolog (human)
 XP_002197978.1 protein tyrosine phosphatase, receptor type, J
 XP_002198016.1 similar to RAB3 GTPase-activating protein
 XP_002198035.1 similar to RAB6 interacting protein 2 isoform 2
 XP_002198100.1 Ras-related protein Rab-11A
 XP_002198145.1 solute carrier family 35, member B3
 XP_002198208.1 mucin protein
 XP_002198220.1 similar to mCG142254
 XP_002198356.1 forkhead box M1, partial
 XP_002198390.1 hephaestin-like 1
 XP_002198941.1 similar to gag-pro-pol polyprotein
 XP_002199156.1 eukaryotic translation initiation factor 3, subunit E
 XP_002199382.1 enhancer of rudimentary homolog
 XP_002199408.1 actinin, alpha 1
 XP_002199773.1 similar to KIAA0427
 XP_002199885.1 similar to ATP synthase subunit beta, mitochondrial, partial
 XP_002199976.1 similar to Pro-Pol polyprotein
 XP_002200055.1 serine palmitoyltransferase, long chain base subunit 2
 XP_002200097.1 cytoskeleton associated protein 5
 XP_002200222.1 similar to Pol polyprotein, partial
 XP_002200378.1 similar to transcription initiation factor IIIB
 XP_002200388.1 similar to mCG146312
 XP_002200416.1 AT rich interactive domain 4A (RBP1-like)
 XP_002200448.1 DDHD domain containing 1
 XP_002200465.1 similar to liver glycogen phosphorylase
 XP_0022660420.1 primary ciliary dyskinesia protein 1
 XP_0022660427.2 hypothetical protein LOC100330744
 XP_0022660455.1 heparan-alpha-glucosaminide N-acetyltransferase
 XP_0022660488.2 LOW QUALITY PROTEIN: si:key-257n17.3
 XP_0022660517.2 dynamin-binding protein
 XP_0022660539.2 hypothetical protein LOC100333395
 XP_0022660581.1 catenin delta-1-like
 XP_0022660602.2 axonal transport of synaptic vesicles-like, partial
 XP_0022660608.2 protocadherin Fat 1
 XP_0022660723.2 hypothetical protein LOC100330703
 XP_0022660725.2 hypothetical protein LOC100330916
 XP_0022660769.1 ecotropic viral integration site 5 protein homolog
 XP_0022660843.1 vasoactive intestinal polypeptide receptor
 XP_0022660902.2 protein RSM22 homolog, mitochondrial
 XP_0022660903.2 telomerase protein component 1
 XP_0022660932.1 hypothetical protein LOC100330518
 XP_0022660934.2 fibronectin type III domain-containing protein 7
 XP_0022660976.1 semaphorin-6B
 XP_0022661001.1 hypothetical protein LOC100332501
 XP_0022661011.1 c-C motif chemokine 25-like
 XP_0022661017.2 epidermal growth factor receptor substrate 15-like 1-like, partial
 XP_0022661109.2 ADP-ribosylation factor-binding protein GGA3-like
 XP_0022661144.2 ATP-binding cassette sub-family A member 3-like
 XP_0022661150.1 guanine nucleotide-binding protein G(I)/G(S)/G(O) subunit gamma-12-like
 XP_0022661165.1 LOW QUALITY PROTEIN: c-Jun-amino-terminal kinase-interacting protein 3
 XP_0022661169.1 si:ch211-210g13.5
 XP_0022661186.2 rho GTPase-activating protein 17-like
 XP_0022661202.1 sb:cb1067
 XP_0022661206.2 conserved oligomeric Golgi complex subunit 1, partial
 XP_0022661255.1 hypothetical protein LOC100332647
 XP_0022661262.1 c-type lectin domain family 7 member A-like

XP_002661267.1 hypothetical protein LOC407678
XP_002661402.2 sodium-coupled monocarboxylate transporter 1-like
XP_002661760.2 hypothetical protein LOC100330775
XP_002661971.2 citron Rho-interacting kinase-like, partial
XP_002661979.2 scavenger receptor cysteine-rich domain-containing group B protein-like
XP_002662019.2 LOW QUALITY PROTEIN: 5-hydroxytryptamine receptor 7
XP_002662029.2 probable phospholipid-transporting ATPase ID, partial
XP_002662041.1 major facilitator superfamily domain-containing protein 3
XP_002662049.2 hypothetical protein LOC100321242
XP_002662059.2 hypothetical protein LOC100318173
XP_002662060.2 beta,beta-carotene 9',10'-oxygenase
XP_002662132.2 hypothetical protein LOC116993
XP_002662144.1 tetratricopeptide repeat protein 37-like
XP_002662229.2 tetratricopeptide repeat protein 16-like
XP_002662236.1 hypothetical protein LOC100321354
XP_002662241.2 phosphatidylinositol 4,5-bisphosphate 5-phosphatase A
XP_002662309.2 RNA-binding protein 26
XP_002662350.2 pericentrin
XP_002662357.2 protein Wnt-6-like, partial
XP_002662391.1 phosphoinositide 3-kinase regulatory subunit 5
XP_002662398.2 LOW QUALITY PROTEIN: trinucleotide repeat-containing gene 6C protein
XP_002662476.2 hypothetical protein LOC550304
XP_002662477.2 transforming growth factor beta receptor type 3-like
XP_002662505.1 LOW QUALITY PROTEIN: dedicator of cytokinesis protein 7
XP_002662553.2 metabotropic glutamate receptor 2
XP_002662555.2 FERM domain-containing protein 4B-like
XP_002662564.2 cell adhesion molecule with homology to L1CAM (close homolog of L1) b, partial
XP_002662570.2 hypothetical protein LOC100332241
XP_002662593.2 hyaluronidase-2-like
XP_002662598.2 deoxynucleotidyltransferase terminal-interacting protein 1-like, partial
XP_002662604.2 alpha-1-syntrophin-like, partial
XP_002662613.2 hypothetical protein LOC100334461, partial
XP_002662615.2 integral membrane protein GPR180-like, partial
XP_002662629.1 hypothetical protein LOC100332081
XP_002662792.2 pro-interleukin-16-like, partial
XP_002662851.1 hypothetical protein LOC100333688
XP_002662855.2 hypothetical protein LOC100334500
XP_002662869.1 leishmanolysin-like peptidase-like
XP_002662886.1 immunoglobulin superfamily DCC subclass member 4
XP_002662889.1 amyloid beta A4 precursor protein-binding family A member 2
XP_002662902.1 WD repeat-containing protein 60-like
XP_002662910.2 t-cell immunomodulatory protein-like
XP_002662959.1 im:7138475
XP_002662979.2 A disintegrin and metalloproteinase with thrombospondin motifs 7-like
XP_002662989.1 DNA replication factor Cdt1
XP_002662990.2 ankyrin repeat domain-containing protein 11
XP_002663014.1 mannose receptor, C type 1a
XP_002663051.2 inactive ubiquitin carboxyl-terminal hydrolase 53-like, partial
XP_002663052.2 hypothetical protein LOC100333879, partial
XP_002663080.2 hypothetical protein LOC100331748, partial
XP_002663085.2 5,6-dihydroxyindole-2-carboxylic acid oxidase
XP_002663107.2 ATP-sensitive inward rectifier potassium channel 10-like, partial
XP_002663116.2 hypothetical protein LOC100332563
XP_002663119.2 ubiquitin carboxyl-terminal hydrolase 11
XP_002663133.2 LOW QUALITY PROTEIN: tyrosine-protein kinase JAK2
XP_002663145.2 epidermal growth factor receptor substrate 15
XP_002663202.2 zinc finger protein 608-like
XP_002663214.2 protein FAM107A
XP_002663220.2 coiled-coil domain-containing protein 157
XP_002663267.2 A disintegrin and metalloproteinase with thrombospondin motifs 13
XP_002663277.1 FERM domain-containing protein 3
XP_002663285.2 long-chain-fatty-acid--CoA ligase 6-like, partial
XP_002663289.2 uncharacterized protein KIAA1751 homolog
XP_002663297.2 LIM domain transcription factor LMO4.2
XP_002663332.2 hypothetical protein LOC100330630
XP_002663342.2 dedicator of cytokinesis protein 9-like, partial
XP_002663359.2 activin receptor type-1C-like, partial
XP_002663366.1 solute carrier family 23 member 3-like
XP_002663398.2 transcription cofactor vestigial-like protein 3-like
XP_002663414.2 nebulin
XP_002663415.2 collagen alpha-3(VI) chain
XP_002663441.1 TBC1 domain family member 4
XP_002663454.2 hypothetical protein LOC450004
XP_002663466.2 hypothetical protein LOC100332907, partial
XP_002663480.2 RNA-binding protein 27-like
XP_002663492.2 TBC1 domain family member 8
XP_002663494.1 e3 ubiquitin-protein ligase TTC3
XP_002663536.1 inositol hexakisphosphate and diphosphoinositol-pentakisphosphate kinase 2
XP_002663560.2 hypothetical protein LOC100329499

XP_002663587.2 phospholipase DDHD2
 XP_002663594.1 periostin
 XP_002663598.2 hypothetical protein LOC100331563
 XP_002665109.2 breast cancer anti-estrogen resistance protein 3 homolog, partial
 XP_002665537.2 x-ray repair cross-complementing protein 5-like
 XP_002665632.2 pumilio homolog 1
 XP_002665681.1 laminin subunit alpha-2
 XP_002667041.2 hypothetical protein LOC100334622
 XP_002667064.2 exportin-1, partial
 XP_002667090.2 partitioning defective 3 homolog B, partial
 XP_002667242.2 zinc finger protein 618
 XP_002667267.2 polypeptide N-acetylgalactosaminyltransferase 5-like, partial
 XP_002667272.2 hypothetical protein LOC100329851
 XP_002667279.1 hypothetical protein LOC100330441
 XP_002667295.2 hypothetical protein LOC100332327
 XP_002667335.2 butyrophilin subfamily 1 member A1-like
 XP_002667385.1 serine/threonine-protein kinase ppk4-like
 XP_002667402.2 cysteine/serine-rich nuclear protein 3-like
 XP_002667416.2 myotubularin-related protein 3-like, partial
 XP_002667679.2 RNA-binding motif, single-stranded-interacting protein 1-like, partial
 XP_002667690.2 leucyl-tRNA synthetase, cytoplasmic-like
 XP_002667886.2 protein kinase C alpha type-like, partial
 XP_002931510.1 uncharacterized protein C1orf177-like
 XP_002931524.1 LOW QUALITY PROTEIN: polypeptide N-acetylgalactosaminyltransferase 2-like
 XP_002931653.1 LOW QUALITY PROTEIN: ubiquitin carboxyl-terminal hydrolase 24-like
 XP_002931680.1 LOW QUALITY PROTEIN: cleavage stimulation factor subunit 3-like
 XP_002931684.1 hypothetical protein LOC100493525
 XP_002931732.1 hydrocephalus-inducing protein homolog
 XP_002931740.1 putative myosin light chain kinase 3-like
 XP_002931747.1 box C/D snoRNA protein 1
 XP_002931799.1 hypothetical protein LOC100489553
 XP_002931877.1 hypothetical protein LOC100495247
 XP_002931884.1 filamin-C isoform 1
 XP_002931886.1 filamin-C isoform 3
 XP_002931909.1 hypothetical protein LOC100491312
 XP_002932028.1 LOW QUALITY PROTEIN: dynein heavy chain 3, axonemal-like
 XP_002932065.1 hypothetical protein LOC100488389
 XP_002932216.1 fibronectin-like
 XP_002932237.1 GRAM domain-containing protein 4 isoform 2
 XP_002932311.1 hypothetical protein LOC100493590
 XP_002932343.1 LOW QUALITY PROTEIN: anoctamin-2-like

IQXP	A Chain A, Crystal Structure Of A Mu-Like Calpain
1VJY	A Chain A, Crystal Structure Of A Naphthyridine Inhibitor Of Human Tgf- Beta Type I Receptor

3F5F A Chain A, Crystal Structure Of Heparan Sulfate 2-O-Sulfotransferase From Gallus Gallus As A Maltose Binding Protein Fusion.

2H07 A Chain A, Crystal Structure Of Human Phosphoribosyl Pyrophosphate Synthetase 1 Mutant S132a

3TW4 A Chain A, Crystal Structure Of Human Septin 7 Gtpase Domain

2IFM A Chain A, Crystal Structure Of Human Ste20-Like Kinase (Unliganded Form)

4EGC A Chain A, Crystal Structure Of Mbp-fused Human Six1 Bound To Human Eya2 Eya Domain

4IVG A Chain A, Crystal Structure Of Mitochondrial Hsp90 (trap1) Ntd-middle Domain Dimer With Ampnp

1OE9 A Chain A, Crystal Structure Of Myosin V Motor With Essential Light Chain - Nucleotide-Free

3I5D A Chain A, Crystal Structure Of The Atp-Gated P2x4 Ion Channel In The Closed, Apo State At 3.5 Angstroms (R3)

4IL1 A Chain A, Crystal Structure Of The Rat Calcineurin

1D4O A Chain A, Crystal Structure Of Transhydrogenase Domain Iii At 1.2 Angstroms Resolution

4J2X A Chain A, Csl (rbp-jk) With Corepressor Kyot2 Bound To Dna

4FHH A Chain A, Development Of Synthetically Accessible Non-Secosteroidal Hybrid Molecules Combining Vitamin D Receptor Agonism And Histone Deacetylase Inhibition

4C1B A Chain A, Esterase Domain Of The Zf12-1 Orf1 Protein From The Zebrafish Zf12-1 Retrotransposon

2QOF A Chain A, Human EphA3 Kinase And Juxtamembrane Region, Y596f Mutant

4NFM A Chain A, Human Tau Tubulin Kinase 1 (ttk1)

2LMD A Chain A, Minimal Constraints Solution Nmr Structure Of Prospero Homeobox Protein 1 From Homo Sapiens, Northeast Structural Genomics Consortium Target Hr4660b

1SGH A Chain A, Moesin Ferm Domain Bound To Ebp50 C-Terminal Peptide

4ANJ A Chain A, Myosin Vi (Minsert2-Gfp Fusion) Pre-Powerstroke State (Mg.Adp.Alf4)

2M8E A Chain A, Nmr Structure Of The Pai Subdomain Of Sleeping Beauty Transposase

2VQ8 A Chain A, Rnase Zf-1a

1BR2 A Chain A, Smooth Muscle Myosin Motor Domain Complexed With Mgadp.Alf4

2I3E A Chain A, Solution Structure Of Catalytic Domain Of Goldfish Rich Protein

1JGN A Chain A, Solution Structure Of The C-Terminal Pabc Domain Of Human Poly(A)-Binding Protein In Complex With The Peptide From Paip2

2EQO A Chain A, Solution Structure Of The Stn_traf3ip1_nd Domain Of Interleukin 13 Receptor Alpha 1-Binding Protein-1

1P0R A Chain A, Solution Structure Of Ubl5 A Human Ubiquitin-Like Protein

2G9A A Chain A, Structural Basis For The Specific Recognition Of Methylated Histone H3 Lysine 4 By The Wd-40 Protein Wdr5

4KHA A Chain A, Structural Basis Of Histone H2a-h2b Recognition By The Essential Chaperone Fact

1ZD9 A Chain A, Structure Of Human Adp-Ribosylation Factor-Like 10b

2IW8 A Chain A, Structure Of Human Thr160-Phospho Cdk2-Cyclin A F82h-L83v- H84d Mutant With An O6-Cyclohexylmethylguanine Inhibitor

3LJE A Chain A, The X-Ray Structure Of Zebrafish Rnase5

4BTJ A Chain A, Tbk1 In Complex With Atp

4BJ8 A Chain A, Zebavidin

4C84 A Chain A, Zebrafish Znr3 Ectodomain Crystal Form I
