

**Is There an Equity Gap in Marching Band Competition?
Relationships between School Demographics and Participation and Competitive Rankings
at Bands of America Marching Competitions**

by

Martin Coy Lenard

ABSTRACT

Socioeconomic status (SES) is linked to multiple interacting systems, including students' racial and ethnic background, grade level, and school/neighborhood location (Brooks-Gunn & Duncan, 1997). In music education research literature, SES has often been used as a non-music variable to determine its effect on recruitment and retention in instrumental music programs (Albert, 2006; Corenblum & Marshall, 1988), musical achievement and outcomes (Bailey, 2018; Dame, 2010), and participation in music (Chappell, 2013; Elpus & Abril, 2011).

The purpose of this quantitative study was to examine the relationships between school demographics and participation and competitive rankings at Bands of America (BOA) marching competitions. Specific research questions were:

- 1) What are the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating in BOA competitions across the United States of America?
 - a. What are the differences between ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating at BOA competitions and all public schools in the United States of America?
 - b. What are the differences between ethnicity demographics and free-reduced lunch percentages of Texas schools participating at BOA competitions and all public schools in the State of Texas?
- 2) Is there a difference between finalist and non-finalist schools' free-reduced lunch percentage and income-to-poverty ratio at BOA competitions?

- 3) What is the relationship between free-reduced lunch percentage and income-to-poverty ratio and the scores at BOA Regional Championship competitions?

Data were collected from 558 high schools throughout the United States of America that competed at one of the 22 BOA events in 2018. The dependent variables were contest results and scores collected from the Bands of America website. The independent variables were ethnicity demographics, the number of students who were eligible for free and reduced lunch, and income-to-poverty ratio information collected from the National Center for Education Statistics for each of the participating high schools. Simple linear regression, one-sample *t*-test, independent sample *t*-test, and factorial AVOVA were completed to analyze the data, using *Statistical Package for the Social Sciences* (SPSS) 26.0 statistics software.

Results revealed a significant difference between the demographics of schools that participate at 2018 BOA competitions and the public schools in the USA. A school that participated in a BOA competition was more likely to have fewer students on free-reduced lunch and have higher income-to-poverty ratio scores compared to the national average. Based on the Factorial ANOVA analysis, IPR does not appear to have the same relationship as the variable FRL. However, bot variables had comparable results with the regression model and a similar R^2 variance.

Recommendations for future research include examining public records of school budgets to determine the actual expenditures marching bands accrue each competitive season. Another recommendation is examining the impact of COVID-19 on music competitions and how the pandemic impacted participation in marching band competitions. The last recommendation is replicating this current study with other national marching band circuits, such as US Bands.

DEDICATION

To Halya: None of this is possible without you.

ACKNOWLEDGMENTS

First, I want to thank my amazing wife for her support and constant encouragement during this journey. She is the rock of our family and provided the support for me to be able to focus on my work towards this degree. This was a team effort which included our beautiful daughters, Madea (7) and Emma (4). They would bring me drawings and notes of support while working on assignments. The team also includes my parents, Tony and Debra Lenard, who would help watch the girls or offer encouragement along the way.

Thank you to my advisor, Dr. Nancy Barry, for her support, expertise, and non-stop encouragement. She is a champion of her students and is a role model for all faculty advisors.

Thank you to the group chat with Kevin Dugat, Tyler McClendon, and Seth Lafler for always being supportive and providing humor during challenging days.

Thank you to the supportive colleagues and faculty of Schreiner University who provided support and gave advice along the way.

Thank you to local community members in Kerrville that checked in on my progress and provided support such as Jeremy Walther, Konrad Wert, Tina and Clint Carter, Katherine Boyett and Jason Reed, Louis Amestoy, Mark Foust, Kate and Corbin Thompson, Aaron Yates, Kristopher Brown, Sam Dreeben, and Jimmy and Analaura McCrae.

CHAPTER ONE

INTRODUCTION

The 1954 U.S. Supreme Court decision in *Brown vs. Board of Education* was a turning point in American public education, striking down the “separate but equal” policy in American schools. After this ruling, public schools were required to offer equal access to education for students of all races (Graham, 2005). While many schools began the process of integration, some states avoided the mandate by obstructing the process. Major legislation after *Brown vs. Board of Education* was The Civil Rights Act in 1964, which emphasized racial desegregation in schools, banned discrimination in the workplace, and equalized the voting registration process. This led to the 1965 Elementary and Secondary Education Act (ESEA), which encouraged desegregation by linking federal aid to school districts with students who live below the poverty line. This act only applied to districts that were not in violation of the Civil Rights Act. Today, ESEA is commonly referred as Title 1 within the Department of Education (Graham, 2005).

American schools today serve students representing a wide range of race, ethnicity, language, gender, religion, disabilities, and socioeconomic backgrounds. Willie, Edwards, and Alves (2002) found socioeconomically and racially balanced schools had higher achievement in test scores and school ratings than schools with homogenous populations. Other positive outcomes of a diverse school may include higher graduation rates, higher grades, feelings of safety, and reduced prejudice (Juvonen, Nishina & Graham, 2006; Mickelson, 2007). However, while students may benefit from a diverse population, some schools have failed to meet the needs of specific student populations, including low income and minority students (Willie, Edwards & Alves, 2002).

Poverty is one of the aspects of education that can impact the student's success. According to the U.S. Census Bureau (2020), 16.8% of children under the age of 18 lived in poverty in 2019. One indicator of growing poverty in children under the age of 18 is percentage of students eligible for the National School Lunch Program. According to the U.S. Department of Education National Center for Education Statistics (2017), 52.3% of students in public schools are eligible for the federally assisted lunch program, also known as the Free/Reduced-Price Lunch (FRL) Program. This represents a 9.4% increase in students that qualified from 2009. According to the U.S. Census Bureau (2020), the poverty threshold for a family of four income is \$22,600. Children in a household with incomes at or below 130 percent of the federal poverty level are eligible for free school meals. Children in households with incomes between 130 to 185 percent of the federal poverty level are eligible for reduced-price school meals.

Students in poverty face disadvantages compared to higher-income peers. Research indicates that students from low socioeconomic backgrounds tend to have lower achievement levels than students from higher socioeconomic backgrounds (Brooks, 1988; Caldas & Bankston, 1997, Coleman et al., 1966; Duncan & Magnuson, 2005; Entwisle, Alexander & Olson, 2010; Rumberger, 2007; Willie, Edwards & Alves, 2002). Additionally, studies have shown that students from low-income families who attend schools with a majority of low-income students will continue to underperform in school (Rumberger & Palardy, 2005).

Comparable to its relationship with academics, lower socioeconomic impact opportunities for student achievement in music education. Music programs in schools with low socioeconomic levels report fewer students taking private lessons, weak parental support, lower program fees, and few technological resources (Costa-Giomi & Chappell, 2007). Schmidt, Baker, Hayes, and Kwan (2006) found that schools with a higher percentage of students

qualifying for free or reduced lunch receive fewer distinguished ratings at adjudicated music festivals.

Marching Bands

Marching bands have been a long tradition in high schools throughout the United States. Marching band competitions are associated with high levels of performance and pageantry in performing arts. Rockefeller (1982) noted that marching band competitions' popularity increased over the years including local, state, regional and national contests. One marching band competitive circuit with tremendous growth in festival offerings was Bands of America (BOA). There were only eight BOA marching competitions across the country in 1985, but by 2019, BOA had grown to 23 marching band competitions throughout the United States.

Music education philosophers Reimer (1989) and Elliott (1995) suggested that emphasis on competitions may have a negative effect on the philosophical basis of music education and undermine the aesthetic appeal of successful musical performances. Because of the growth of marching band competitions and their popularity (Miles, 1993; Rockefeller, 1982) directors may feel pressure from administrators and parents to compare their program to other bands and use marching band competitions as a part of their curriculum.

Bands of America

Bands of America (BOA) is a division of "Music for All, Inc." BOA was formed in 1976 under the name of "Marching Bands of America." In the beginning, Marching Bands of America was a single summer workshop for band directors held at the University of Wisconsin – Whitewater. The workshop included drill design and adjudication sessions for high school band directors. In 1984, Marching Bands of America was renamed Bands of America and merged with Music for All Foundation in 2006. (www.musicforall.org, 2020).

At BOA events, marching bands only receive ratings during preliminary competition. As the marching season progresses, the rating system for the marching band becomes more stringent. Table 1 and 2 refer to the different rating standards prior to or on/after October 15th for each year.

Table 1

Ratings at BOA events prior to October 15th

Score	Rating
70.00 and above	I
55.00 – 69.95	II
40.00 – 54.95	III
39.95 and below	IV

Table 2

Ratings at BOA events on or after October 15th

Score	Rating
75.00 and above	I
60.00 – 74.95	II
45.00 – 59.95	III
44.95 and below	IV

The total score is comprised of the following categories: 20 potential points for music performance, 20 potential points for visual performance and 60 potential points for general effect. The points for music performance come from two judges: one judge for individual performance and the second judge for the ensemble. Visual performance requires a similar structure with one judge assigned to individual performance and one judge for ensemble. There is one judge for visual general effect for 20 points and two music general effect judges for 20 points each. Scores from the two judges for visual and music performance are averaged for a

total of 20 points for each category. Appendix B are sample scoresheets and criteria reference that are used by the judges during BOA marching competitions.

There was a total of 22 BOA marching competitions scheduled throughout the United States in 2018 (see Appendix C). BOA hosts three categories of competitions each year: Regional (one day only); Super Regionals (held over two days) and concludes with the Grand National Championships in Indianapolis, Indiana. Eighteen of the competitions in 2018 were Regional championships and three of them were Super Regional Championships.

Need for the Study

With the growth of BOA competitions throughout the United States, further examination of the circuit can provide more information about the type of high schools that participate. What are the ethnicity demographics, free-reduced lunch percentage and poverty rate of schools that participate at BOA marching competitions? Previous research has examined demographics of marching bands that participate at individual marching festivals or examined contests in one state (O’Leary, 2016; Stern, 2019; Stern, 2021; Sullivan, 2003; Washington, 2007). This research study will examine the demographics of high schools that competed at BOA marching contests held throughout the United States during the 2018 season.

Purpose and Research Questions

The purpose of this quantitative study was to examine the relationship between selected school demographics on participation and competitive rankings at Bands of America marching competitions. Specific research questions are:

- 1) What are the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating in BOA competitions across the United States of America?

- a. What are the differences between ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating at BOA competitions and all public schools in the United States of America?
 - b. What are the differences between ethnicity demographics and free-reduced lunch percentages of Texas schools participating at BOA competitions and all public schools in the State of Texas?
- 2) Is there a difference between finalist and non-finalist schools' free-reduced lunch percentage and income-to-poverty ratio at BOA competitions?
 - 3) What is the relationship between free-reduced lunch percentage and income-to-poverty ratio and the scores at BOA Regional Championship competitions?

Null Hypothesis:

H_0 = There is no relationship between ethnicity demographics, free and reduced lunch price eligibility, or income-to-poverty ratio on the participation and contest results of Bands of America competitions.

Alternative Hypothesis:

H_a = There will be a statistically significant relationship between ethnicity demographics, free and reduced lunch price eligibility or income-to-poverty ratio with the participation and contest results of Bands of America competitions.

CHAPTER TWO

REVIEW OF LITERATURE

Overview

The purpose of this study was to examine the relationship between selected school demographic variables on participation and competitive rankings at Bands of America marching competitions. This review of literature will examine topics including (a) history of competition in music, (b) history of marching band, (c) research on marching band competition, (d) socioeconomic status, and (e) socioeconomic status and music education.

History of Competition in Music

Competition is a strategy used to embolden students to achieve educational goals. In the area of music, competition has been examined in the literature as a motivational tool (Austin, 1988; Schmidt, 2005) and the influence of extra-musical factors on the fairness of competitive events (Bergee & Platt, 2003; Bergee & McWhirter, 2005). Competition has been a part of musical performances throughout history. Historical evidence suggests that contests for instrumental and vocal performers were present as early as 1737 (Mark & Gary, 1992). Keene (1982) noted that the first contest held for public school music students was in 1897 in Boston, Massachusetts.

Researchers consider the National School Band Contest of 1923 as the official beginning of the music competition movement in the United States (Payne, 1997). This contest was also known as the National School Band Tournament. Sponsored by music instrument manufacturing companies, this competition increased awareness and popularity of marching bands. The tournament took place in Chicago, Illinois during the Music Industries Chamber of Commerce

convention. The goal of the convention was to expand the market for musical instruments throughout the United States (Holz, 1966; Moore, 1972; Payne, 1997).

Between 1926 and the 1930s, national contests continued to grow yearly with scoring modifications made over time. Modifications included scoring for marching execution and music performance to select the winner more accurately. In 1927, bands participating in the national contests divided into different competitive classes based on school enrollment. In 1928, band size began to be considered, with a requirement of 72-members to qualify to participate in national contests. After 1931, the contest scoring system was adjusted from a placement format to a “division” rating system based upon a marching band’s performance. A “I” rating indicated a superior performance, “II” for excellent performance, “III” for a good performance, “IV” for a below average performance, and “V” for a poor performance (Rickels, 2011). Rankings, or ratings, were intended to give students a feeling of accomplishment and to develop a sense of pride on a job well done in a competitive situation (Mason et al., 1985).

Before the start of World War II, districts and state contests had become an important factor leading to the promotion and expansion of instrumental music instruction in the United States (Keene, 1982). With the start of World War II, the state contest movement slowed down throughout the country. However, states began to modify their own systems by organizing their district events with traveling judges, requiring graded music selection, and developing educational clinics. These developments at the state level are still key to music education today (Rickels, 2009).

Research on Marching Band Competition

Military tradition was the inspiration of early marching band competitions (Hazen & Hazen, 1987). Most of the early competitions were sponsored by veteran services groups such as

the American Legion and the Veterans of Foreign Wars. These events were for non-school organizations, but later evolved into public school events (Vickers, 2002). Street parade competitions were popular between the 1960s and 1970s, which later evolved to competitions held on football fields (Rickels, 2009). As marching band performances during halftime of football games became prevalent, marching competitions soon spread throughout the United States (Rogers, 1985).

Marching band competitions provide a venue to perform and receive ratings and/or rankings. Formats for marching band competition evaluations have evolved over the years, with most organizers using the same adjudication criteria adopted by Drum Corps International (Laib, 1984). Standardized marching band adjudication systems have evolved and included the use of captions to assess musical, visual, and general effect categories (Vance, 2014). According to Bands of America evaluation system, the visual performance caption measures the individual performers' marching drill and movement execution on the field and includes the individual performers' problems in drill execution. General effect measures the marching band members' ability to produce an emotional response from the audience (www.musicforall.org, 2020). Although BOA has standardized their adjudication training and practices, not all local and state competitions have followed suit (Rickels, 2009).

Payne (1997) reviewed literature concerning band competitions across three different areas of research: history of band competitions, effects of band competitions, and the controversy over competition. He drew four conclusions. First, the literature suggests that attitudes concerning band competitions are a positive experience with those involved, however it becomes less appealing as students grow older. Second, arguments citing "potential damage to student motivation and self-esteem [were] not supported" in the research (1997, pp. 11-12). Third, most

studies demonstrated that the levels of individual and group performance achievement in music tended to be positively influenced in competitive settings. Finally, a trend appeared in the research showing that larger schools tended to outperform smaller schools at marching competitions.

State and Nation-Wide Studies on Marching Band Competitions

Researchers have examined marching band competitions at individual and statewide festivals while looking at variables that could influence results. Saul (1977) examined results of Mississippi marching band festivals and compared the level of director education and experience, student demographics, and administrative support. Saul showed that the most significant predictors for success at Mississippi marching band festivals were the organization and management of the band program. Other variables that influenced results were the number of students receiving private instruction, amount of funding provided by the school district, playing experience of students, cooperation between the high school and feeder programs, and the number of extra rehearsals held during the marching season. Washington (2007) replicated Saul's 1977 study and found that the most significant predictors of marching band success were the director's age, their teaching experience, and their tenure at the school. Washington also confirmed Saul's results that the size of the marching band, as well as the number of assistant directors on staff, were factors that lead to the ensemble's success.

Laib (1984) focused on marching festivals held in Georgia and examined the relationship between marching band competitions, show styles, and the number of shows performed by high school marching bands. Results revealed that bands using corps style of marching tended to adopt rehearsal techniques used by drum corps, required more rehearsal time per marching show, and produced fewer different marching shows during the season.

Eubanks' (2016) case study examined the Camdenton High School band program in Missouri, which regularly participated in BOA competitions. Eubanks found that Camdenton High School band directors were motivated to participate in BOA competitions due to a consistent and rigorous adjudication, motivation to perform, and the effect on students' attitudes. However, the two obstacles that the directors described were school demographics and cost. The director described that adopting the rules and regulations from BOA had changed their approach to show design and increased their expenses for their marching band program. Increased costs for the design of a successful marching band show at BOA were described by the director as follows:

The single drawback I would highlight would be that each year, bands are constantly trying to "out-do" themselves and each other. I think that someday this may make the proper execution of a marching program in the BOA-style cost and time prohibitive for many groups. (Eubanks, 2016, p. 79)

Sullivan (2003) surveyed Arizona high school band directors to determine what factors influence marching bands to participate at regional and state festivals. Results indicated that smaller bands found it difficult to compete with larger bands due to the differences in the availability of resources and the inconsistencies in judging practices and classification systems. Bands that demonstrated success at marching band competitions, such as BOA, had large memberships, additional staff members and larger budgets.

Rickels (2008) surveyed Arizona band directors to examine the relationship between selected variables (e.g., marching band enrollment, assistant/non-certified marching band staff, and band budget) and the results of Arizona marching band contests. Rickels found that neither the band director's experience nor the number of rehearsal hours per week had a significant impact on the marching band's success. However, Rickels determined that the number of non-certified staff, budget size, and number of contests attended had a positive correlation to the

band's success. Results also indicated that larger schools with bigger marching band enrollment received higher scores.

At the national level, Rickels (2009) surveyed band directors and examined similar variables and competitions as their 2008 study. Four hundred and eighteen band directors from six geographical areas of the United States participated in the questionnaire. Rickels used the following non-performance variables: director age and experience, director level of education, number of band staff members, number of hours spent in marching band rehearsal, marching band size, and school budget. Rickels found comparable results to the 2008 Arizona study. The director's age, experience, level of education, and number of hours spent in marching band rehearsal, were not significantly correlated with the success of the marching band. The size of the marching band was a better predictor of success rather than the school size.

The current literature has focused on the relationship between non-performance variables and the program, or performance variables that are measurable. Less research has been conducted about the relationships between other non-performance variables, such as socioeconomic status variables, and the relationship to marching band results.

Socioeconomic Status

One of the most frequently studied variables in educational data is socioeconomic status (Harwell & LeBeau, 2010). Bornstein and Bradley (2002) defined socioeconomic status (SES) as "the relative position of individuals, families, or groups in stratified social systems where some societal values (e.g., occupational prestige, education, economic resources, power, information) are not uniformly distributed" (p.2). White (1982) conducted the first meta-analysis study reviewing literature published before 1980. In their literature review, White discussed six

different situations in which SES was frequently used in educational research in association with measures of academic achievement:

- a concomitant variable in adjusting for bias or pretreatment differences among groups,
- a covariate or stratifying variable to increase the precision of an experiment,
- a stratifying variable to investigate the effect of interactions with other independent variables,
- a descriptive variable to assist other researchers to replicate findings or generalize results,
- a predictor variable, and
- a causal agent.

Different measurements have been used to analyze SES data in educational research, including parent income (Worely & Story, 1967), teacher salaries (Raymond, 1968), parent education (Stanfiel, 1973) and students eligible for free-reduced lunch (Stein et al., 2008). There are limitations with using SES measurement as a variable in education research because of a lack of key definitions, terms, and theoretical assumptions currently in the literature. Harwell and Lebeau (2010) discussed the importance of researchers clearly describing what SES represents in their study. However, there are still issues that occur when referencing the SES literature and how multiple theoretical models exist with a variety of SES definitions.

Eligibility for free-reduced is a frequently used variable in SES literature. Students from families with incomes at or below 130% of the poverty level are eligible for free meals. Those with incomes between 130% and 185% of the poverty level are eligible for reduced-price meals. Harwell, Maeda, and Lee's (2004) replication of White's (1982) meta-analysis found that from 1996 to 2004 approximately 20% of the articles published in the *American Educational Research Journal* and *Sociology of Education* employing an SES measure used the free-reduced lunch

variable. Sirin's (2005) meta-analysis of the relationship between SES and achievement for studies published between 1990 and 2000 reported that approximately 17% of the sampled studies used free-reduced lunch as a measure for SES.

SES is linked to multiple interacting systems, including students' racial and ethnic background, grade level, and school/neighborhood location (Brooks-Gunn & Duncan, 1997). National Center for Education Statistics (NCES) indicated an equity gap, showing that in 2020 on average, lower scores for minority students in comparison with their white peers fell behind in terms of academic achievement (U.S. Department of Education, 2020). Research indicates three main factors to explain the equity gap of lower academic achievement for minority students: minorities are more likely to live in low-income households or in single parent families, their parents are likely to have less education, and they often attend under-funded schools (National Commission on Children, 1991).

Students' socioeconomic backgrounds can impact their academic achievement. The success rate of low-income students in science, mathematics, engineering, and technology disciplines is much lower than that of students who do not come from economically disadvantaged backgrounds (Doerschuk et al., 2016). Children from lower socioeconomic families are entering high school with average literacy skills that are five years behind those of high-income students (Reardon, Valentino, Kalogrides, Shores, & Greenberg, 2013). After high school graduation, individuals within the top family income quartile are eight times more likely to obtain a bachelor's degree by age 24 as compared to individuals from the lowest family income quartile (U.S. Census Bureau, 2014).

The impact of a student's socioeconomic background can begin at an early age and also impact their future career success. Those from higher social class backgrounds tend to be more

successful in developing career aspirations and are better prepared for the work force because of access to resources such as career offices, guidance counselors, better schools, and familiar experience with higher education (Diemer & Ali, 2009). Socioeconomic status variables can have an impact on a student's access to their learning environment, which can have lasting implications. The effects can be detected in young children from low socioeconomic households and communities, as evidenced by slower academic skills developments compared to children from higher SES groups (Morgan, Farkas, Hillemeier, & Maczuga, 2009).

School location and neighborhoods have been a focus in the literature as possible socioeconomic variables. Factors related to improving the quality of schools in low-socioeconomic neighborhoods include a focus on improving teaching and learning, creating an information-rich environment, building a learning community, on-going professional development, involving parents, and increasing funding and resources (Muijs, Harris, Chapman, Stoll, & Russ, 2009). When considering available resources, schools with students from high concentrations of poverty have fewer library resources to depend on than schools serving middle-income students (Pribesh, Gavigan, & Dickinson, 2011).

The Department of Education recently developed a measurement including multiple variables regarding the community surrounding a school location. School Neighborhood Poverty estimates are based on income data from families with children ages 5-18 who were surveyed over a five-year period as part of the U.S. Census Bureau's American Community Survey (ACS). The ACS is a continuous household survey that collects social, demographic, economic, and housing information from the population in the United States each month. The estimates reflect the income-to-poverty ratio (IPR), which is the percentage of family income that is above, or below federal poverty threshold set for the family's size and structure. The IPR indicator

ranges from 0 – 999. Lower IPR values indicate a greater degree of poverty. A family with income at the poverty threshold has an IPR value of 100 (Geverdt, 2018; Geverdt & Nixon, 2018).

Socioeconomic Status and Music Education Research

In music education research literature, SES is often used as a non-music variable. SES has been used to examine its effect on recruitment and retention in instrumental music programs (Albert, 2006; Corenblum & Marshall, 1988; Justus, 2001; Kinney, 2010; Klinedinst, 1991; McCarthy, 1980; Nierman & Veak, 1997); musical achievement and outcomes (Bailey, 2018; Dame, 2010; Howard, 2012; Lien & Humphreys, 2001; Schmit et al., 2006; Sheldon, 1994; Speer, 2012; Speer, 2014) and participation in music (Chappell, 2013; Elpus & Abril, 2011; Elpus & Abril, 2019; Erb, 2019; Smith, 1997).

Researchers have examined the funding provided to band programs and found that the most schools have inadequate funding to support the high costs associated with a competitive marching band program. Prescott (1982) surveyed band directors and found that only 24% felt that their programs were fully funded by the local school board. Chenault (1993) surveyed band directors in North Carolina and found 50% of the respondents were required to fundraise half of their funding. Galloway (1986) surveyed Alabama high school band directors and found 85% of the bands received most of their funds from band parent booster organizations. Elpus and Grisé (2019) concluded that booster programs often serve to alleviate or exacerbate inequality in the funding of music education. The authors noted a significant correlation between the median household income of a postal zip code and the amount of money raised by music booster clubs within that area. The findings indicate that bands from higher-SES communities are more

successful at fundraising than bands from lower-SES communities who may experience greater financial need.

Researchers have examined the SES of participating marching band's schools in relationship to marching band competitions. O'Leary (2016) found that marching bands advancing to Bands of America Grand National finals tended to be from communities whose families had above-average incomes for their state and have few students on free-reduced lunch at their school. Speer (2014) considered the effects of SES on the University Interscholastic League ratings of concert band and choir programs in Texas. The results indicated a significant correlation between SES and attained contest ratings.

The relationship between participation at music contests and SES has been another area of research interest. Perrine (2016) examined the effects of selected non-musical characteristics and band festival participation scores. Non-musical characteristics examined were band size, school enrollment, school percentage of minority enrollment, and free-reduced lunch compared to the concert band festival participation, scores, and literature selection. Pearson correlations revealed significant relationships between percentage of students on free or reduced lunch and the percentage of minority students ($r = .61, p < .001$), including a 36% shared variance. School size and literature difficulty had a significant positive correlation ($r = .51, p < .001$) with festival scores. A one-way ANOVA revealed that schools with higher percentages of minority students and students eligible for free-reduced lunch were less likely to participate at a band contest.

Stern (2021) examined the correlation between a school's percentage of students receiving free-reduced lunch and scores attained at a large marching band festival. Stern performed a simple linear regression using SPSS software with competing bands' scores from the BOA San Antonio Super Regional competition serving as the dependent variable, and the

percentage of students receiving free-reduced lunch from each school as the independent variable. Results indicated a significant regression ($F(1,67) = 55.63, p < .001$), with an R^2 of .457, meaning that 45.7% of the variance in rankings can be explained by variance in SES. Because Stern only analyzed data from one BOA contest, expanding the analysis to all contest in a competitive season could provide further insight to the literature.

Summary

This literature review revealed that previous studies employed a variety of method designs to examine the relationship of SES and marching band competitions. Studies with a survey design focused on statewide competitions or national marching band circuits (Mulchay, 2017; Rickels, 2008; Sullivan, 2003). Studies that utilized publicly available information focused on individual marching festivals (O’Leary, 2016; Stern, 2021). This literature review revealed that there is an existing gap in the literature, as there have not been previous studies completed that examine a national band circuit utilizing publicly available data, such as school demographics. Research is needed to expand the current literature by examining the relationship of a school’s SES and the participation and results achieved in marching band competitions held throughout the United States using publicly available data including free-reduced lunch, income-to-poverty ratio, and ethnicity demographics.

CHAPTER THREE

METHODS

Research Design

I used a quantitative design focused on collecting data through publicly available information. Data were collected from the Music for All website of high schools ($N = 575$) participating in the Bands of America (BOA) competitions held across the United States of America in 2018. There were three types of BOA marching contests held in 2018 ($N = 22$): Regional Championships ($n = 18$), Super Regional Championships ($n = 3$) and Grand Nationals ($n = 1$).

Student free-reduced lunch eligibility is often used by researchers for measuring poverty and socioeconomic disadvantage (Costa-Giomi & Chappel, 2007; Doyle, 2012; Fitzpatrick, 2006; Good, 1997; Kinney, 2008; Kinney, 2010; Kinney & Forsythe, 2005; Nichols, 2003; Stern, 2021). Based upon the previous research, I elected to use free-reduced lunch percentage as one of the variables in this study along with ethnicity demographics and income-to-poverty ratio. Ethnicity demographics and free-reduced lunch information for schools were collected from the National Center for Education Statistics (NCES) Common Core database. Ethnicity demographic percentage was calculated by the combined number of students identifying with a race category divided by the student population of the school. Free-reduced lunch percentage was calculated by the combined number of students eligible divided by the student population of the school. Income-to-poverty ratio score for each high school were collected from the NCES Education Demographic and Geographic estimates database. High school data were collected and entered in an Excel spreadsheet (see Appendix F).

BOA contest results and demographic information were combined and entered in a separate Excel spreadsheet for each marching competition in 2018. Contest information for each high school included music performance average score, visual performance average score, general effect score, subtotal of score, place overall, class, place in class and rating. Demographic information included NCES school ID, income-to-poverty ratio, total school enrollment, grade level enrollment, ethnicity demographics, and free and reduced lunch eligibility information. Private schools' data are not available on the NCES website and were not included in this study. Data included information from public or charter schools receiving federal funding. Each contest had a preliminary and finals competition, except the Dallas/Fort Worth Regional Championship, which did not have a final performance due to weather cancelation. The Waco Regional Championship was canceled due to weather conditions and was not examined for this study.

Data Analysis

I used the *Statistical Package for the Social Sciences* (SPSS) 26.0 statistics software for data analysis. A simple linear regression was performed using competing bands' scores from BOA competitions as the dependent variable, and the percentage of free-reduced lunch, income-to-poverty ratio and ethnicity demographics from each school serving as independent variables. Using the means for income-to-poverty ratio, ethnicity demographics and free-reduced lunch percentage, One-way analysis of variance (ANOVA) was performed to determine if any statistically significant difference exists between the three independent variables. Similar to Stern (2021), a one-sample *t*-test was performed to compare the mean income-to-poverty ratio, ethnicity demographics and free-reduced lunch percentage of schools whose bands competed at BOA competitions with the similar means of students throughout the United States of America.

The data of all USA public schools includes schools that participated in BOA competitions in 2018. Lastly, an independent sample t test was performed to compare the means of the subgroups of finalist and non-finalists of the Regional Championships. See Table 3 for a summary of the research questions, data source, and data analysis procedures.

Table 3*Summary of the Research Questions, Data Source and Data Analysis Procedures*

Research Question	Data Source/Variables	Type of Data	Analysis
1) What are the ethnicity demographics, free or reduced lunch percentages, and income-to-poverty ratio of schools participating in BOA competitions across the United States of America?	BOA results from <i>Music for All</i> websites. https://marching.musicforall.org/competition-year/2018/ Ethnicity demographics, free and reduced lunch price eligibility and Income-to-poverty ratio data comes from National Center for Education Statistics. https://nces.ed.gov/	Scale	Descriptive (Results in Appendix B) one-sample <i>t</i> -test
a) What are the differences between ethnicity demographics, free or reduced lunch percentages, and income-to-poverty ratio of schools participating at BOA competitions and all public schools in the United States of America?			
b) What are the differences between ethnicity demographics and free or reduced lunch percentages of Texas schools participating at BOA competitions and all public schools in the State of Texas?

CHAPTER FOUR

RESULTS

Introduction

The purpose of this study was to examine the relationships between selected school demographic variables on participation and competitive rankings at Bands of America (BOA) marching competitions. I analyzed the 2018 BOA results collected from <http://www.musicforall.org> and SES demographic variables from <https://nces.ed.gov/>. The quantitative data analysis was performed using SPSS 26.0 statistics software.

Data analysis for this study proceeded in three steps. First, Excel files were created for each 2018 BOA marching competition and included the following information: contest scores, , income-to-poverty ratio, total students at each school, ethnicity demographics, number of students receiving free lunch student and number of students receiving reduced-price student number. I calculated the percentage of students receiving free-reduced lunch by dividing the number of students receiving free-and-reduced lunch by the total of number of students in the school. I calculated the percentage of each ethnic group by dividing the total number of students in each demographic by the number of students in the school. Second, I created one Excel file for all the schools combined with individual data to answer research question #1. Third, I created a SPSS data file for each BOA marching competition.

Question 1: What are the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating in BOA competitions across the United States of America?

Data were combined for all participating schools into one Excel file including ethnicity demographic percentage, free-reduced lunch (FRL) percentage and income-to-poverty (IPR) ratio (refer to Appendix F). Private schools not receiving federal funding from the Department of Education were removed from the data sample. One of the participating marching bands, Plymouth-Canton Educational Park, is made up of three separate high schools. To represent one data point for the marching band, the IPR, FRL and ethnicity demographics data from each of the three schools were averaged. Table 4 shows the descriptive statistics for the bands that participated in a 2018 BOA marching competition.

Table 4

2018 BOA Participants Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
IPR	544	57	962	388.347	166.814
FRL	544	.33%	100%	33.404%	21.526
American Indian/Native	544	.00%	25.79%	.45%	1.486
Asian	544	.00%	84.04%	5.701%	9.232
Black	544	.00%	68.37%	9.148%	10.085
Hispanic	544	.00%	99.92%	22.561%	25.133
Hawaiian/Pacific	544	.00%	10.00%	.194%	.581
White	544	.06%	98.40%	58.361%	26.827
Two or More Race	544	.00%	25.85%	3.418%	2.173

Question 1a: What are the differences between the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating at BOA competitions and all public schools in the United States of America?

Table 5 shows the average ethnicity demographics, free-reduced lunch (FRL) percentage and the income-to-poverty (IPR) ratio of schools participating in a BOA competition in 2018 compared to the averages in the United States of America (USA). Available data for USA public school ethnicity demographics and FRL date from 2016 and IPR data are from 2018. Private schools not receiving federal funding from the Department of Education were removed from the data sample.

Table 5

United States of America Schools and 2018 BOA Participants Average Income-to-Poverty Ratio, Free-Reduced Lunch and Ethnicity Demographics Percentages

SES and Ethnicity Demographic+	USA Public Schools	2018 BOA Participants
IPR*	307.09	388.35
FRL**	52.30%	33.4%
American Indian/Native**	1%	0.45%
Asian**	5.10%	5.70%
Black**	15.30%	9.15%
Hispanic**	26.40%	22.56%
Hawaiian/Pacific**	0.40%	0.19%
White**	48.20%	58.36%
Two or More**	3.60%	3.42%

Note. + Based on U.S. Government Categories
 * 2018 Data. ** 2016 Data

Schools that participated in a BOA competition on average had a higher IPR score compared to the average of public schools in the USA. Percentage of students that were eligible

for free-reduced lunch was lower for schools that participated at BOA competitions compared to the average for the USA. A one-sample *t*-test for independent samples was conducted comparing the average of FRL, IPR and ethnicity demographics to determine if there was a statistical significance between USA public schools and BOA participating schools (see Table 6).

Table 6

One Sample t-Test comparing United States of America Public Schools and 2018 Bands of America Participants using Free-Reduced Lunch, Income-to-Poverty and Ethnicity Demographics

Demographics	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference		Cohen's <i>d</i>
					Lower	Upper	
IPR*	11.361	543	p < .001	81.25	67.2082	95.3066	0.487
FRL*	-2.629	543	.009	-12.61	-22.0395	-3.1876	- 0.878
American Indian/Native*	-8.624	543	p < .001	-.55	-.6748	-.4245	- 0.370
Asian	1.52	543	.129	.601	-.1761	1.3791	0.065
Black*	-14.225	543	p < .001	-6.15	-7.0005	-5.3013	- 0.610
Hispanic*	-3.562	543	p < .001	-3.83	-5.9553	-1.7219	- 0.152

White*	8.834	543	p < .001	10.16	7.9020	12.4209	0.379
Two or More*	-1.948	543	.05	-.18	-.3643	.0018	- 0.083

* statistically significant

Data from all USA public schools includes schools participating in a BOA competition in 2018. Bands participating in a 2018 BOA competition came from schools with statistically significant lower percentages of students receiving free-reduced lunch compared to all USA public schools. Income-to-poverty ratio was significantly higher for BOA competing schools compared to all public schools in the United States.

Question 1b: What are the differences between the ethnicity demographics and free-reduced lunch percentages of Texas schools participating at BOA competitions and all public schools in the State of Texas?

Table 7 shows the number of schools from each state participating in at least one BOA contest in 2018. Thirty-seven states had at least one high school from the state participating in a BOA marching competition in 2018.

Table 7

States Represented in a 2018 BOA Marching Contest with at Least One School Participating

State	Number of Schools that Participated	Percentage
Texas	150	27.0%
Ohio	54	9.7%
Indiana	47	8.4%
Missouri	30	5.4%
Illinois	28	5.0%
California	27	4.8%
Florida	26	4.6%
Kentucky	24	4.3%
Utah	17	3.0%
Georgia	16	2.8%
South Carolina	16	2.8%
Tennessee	16	2.8%
North Carolina	11	1.9%
Michigan	10	1.8%
Pennsylvania	9	1.6%
New Jersey	8	1.4%
Virginia	7	1.2%
Arkansas, Oklahoma	6	1.0%
Alabama	5	.09%
Kansas, Mississippi, Nevada	4	.07%
Iowa, Maryland, Minnesota, Nebraska, New Mexico, South Dakota	3	.05%
Arizona, Connecticut, Idaho, Wisconsin	2	.03%
Colorado, Louisiana, Oregon, West Virginia	1	.01%

The majority of schools participating in a BOA competition came from Texas. This can be explained because BOA hosts six Regional Championships and one Super Regional Championship in Texas. Table 8 shows FRL and ethnicity demographics information of schools from Texas participating in a 2018 BOA marching competition. Private schools not receiving federal funding from the Department of Education were removed from the data sample. Income-to-poverty ratio averages for individual States are not currently available through the Department of Education.

Table 8

2018 BOA Texas School Participants Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
FRL	150	.89%	98.48%	41.59%	25.91
American Indian/Native	150	.00%	4.91%	.33%	.451
Asian	150	.00%	44.69%	6.09%	8.311
Black	150	.00%	48.54%	8.79%	9.432
Hispanic	150	5.69%	99.92%	48.17%	28.59

Two or More*	4.693	149	p < .001	.61173	.3541	.8693	0.383

* statistically significant

Texas bands participating in a 2018 BOA competition came from schools with a statistically significant reduced percentage of students receiving free-reduced lunch compared to all Texas public schools. Ethnicity demographics showed statistically significant differences for all races, except White and Hispanic student populations.

Research Question #1 Summary

The data suggest that FRL and IPR have a statistically significant relationship when examining public schools that participate in BOA competitions compared to all public schools in the USA. FRL also appears to impact participation between Texas bands that compete in BOA in 2018 competitions and public schools in the State of Texas. Data suggests that there is a relationship between ethnicity demographics of schools that participated at the 2018 BOA competitions compared to all public schools in the USA. An analysis of Texas ethnicity demographics does not provide a clear picture if there is a relationship with schools participating in a BOA competition.

Question 2: Is there a difference between finalist and non-finalist schools' free-reduced lunch percentage and income-to-poverty ratio at BOA competitions?

A Factorial ANOVA was conducted to compare the main effects of free-reduced lunch percentage and income-to-poverty ratio and the interaction effect between the type of BOA competition on the outcome of being a finalist or non-finalist. The Northern California Regional competition was removed because all participating bands advanced to the finals, which did not yield the two sub-groups of non-finalist and finalist. The Dallas/Fort Worth Regional competition did not hold finals due to weather, however the schools that were named finalists formed the finalist group. An independent samples *t*-tests were conducted using the average of FRL and IPR from participating schools to compare results from finalist and non-finalist bands for individual BOA competitions (refer to Appendix E).

Competition type included three levels (Regional, Super Regional, Grand Nationals) and SES consisted of two levels (free-reduced lunch and income-to-poverty ratio). The main effect for competition type yielded an F ratio of $F(2, 719) = 4.283, p < .014$ with a partial eta effect size of .01, indicating a significant difference between free-reduced lunch percentage. The main effect for finalist and non-finalist subgroups yielded an F ratio of $F(2, 719) = 14.371, p < .001$ with a partial eta effect size of .16, indicating a significant difference between free-reduced lunch percentage. The partial eta effect size represents a large effect and explains 16% of the variance.

Table 11

b. Free-Reduced Lunch Percentage of Schools

The main effect for competition type yielded an F ratio of $F(2, 719) = 1.01, p < .365$, with a partial eta effect of .002, indicating that the effect for income-to-poverty ratio was not significant. The main effect for finalist and non-finalist subgroups yielded an F ratio of $F(2, 719) = 2.363, p < .125$ with a partial eta effect of .003, indicating that the effect for income-to-poverty ratio was not significant.

b. Income-to-Poverty Ratio of Schools

Research Question #2 Summary

Data analysis revealed a statistically significant difference between FRL and whether a band advanced to finals at the 2018 BOA competitions. However, IPR did not reveal a statistically significant difference between non-finalist and finalist bands. Furthermore, the data analysis revealed that there was a statistically significant difference between the FRL percentage and the type of competition the marching band attended. However, the IPR variable did not reveal a statistically significant difference between schools that participated at different BOA competitions. IPR does not appear to have the same relationship as the variable FRL based on the Factorial ANOVA conducted for each of the variables.

Question 3: What is the relationship between free-reduced lunch percentage and income-to-poverty ratio and the scores at BOA Regional Championships competitions?

A scatter plot (see Figure 1) of all bands that competed in a BOA Regional competition showed a negative linear association between the variables of free-reduced lunch and scores at contest, evidenced by a Pearson's correlation coefficient of $r = -.329$. The regression model was significant ($F(1,403) = 48.943, p < .001$, with an R^2 of .108, meaning that 10.8% of the variance in scores can be explained by the variance of free-reduced lunch percentage of the school (see Figure 1).

Figure 1

Relationship between scores at the 2018 Bands of America regional championships and school free-reduced lunch percentage

Another scatter plot (see Figure 2) exhibits a positive linear association between the variables of income-to-poverty ratio and scores at contest with a Pearson's correlation coefficient

of .263. The regression model was significant ($F(1,403) = 29.899, p < .000$, with an R^2 of .069, meaning that 6.9% of the variance in scores can be explained by the variance of income-to-poverty ratio of the participating schools.

Figure 2

Relationship between scores at the 2018 Bands of America regional championships and school income-to-poverty ratio

A scatter plot examining the 2018 BOA Texas competitions showed a negative linear association between a school free-reduced lunch percentage and scores at contest with a Pearson’s correlation coefficient of $-.496$. There was a significant regression ($F(1, 212) = 69.221, p < .000$, with an R^2 of .246, meaning that 24.6% of the variance in scores can be explained by the variance of free-reduced lunch percentage of the school (see Figure 3).

Figure 3

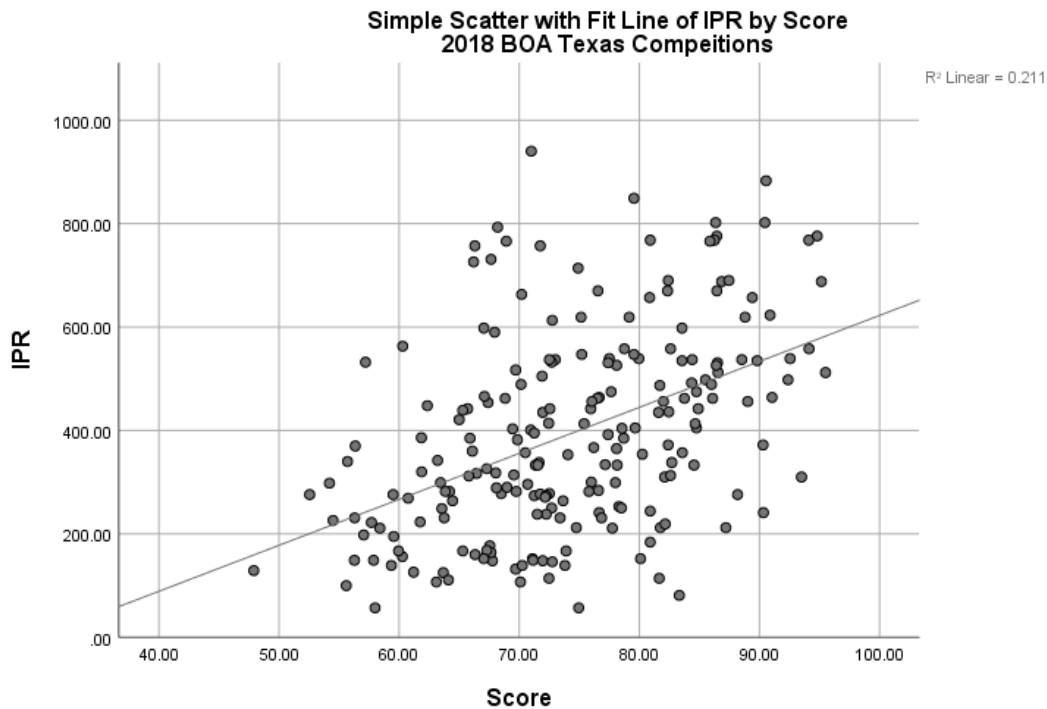

Relationship between scores at the 2018 Bands of America Texas competitions and school free-reduced lunch percentage

Examining schools' participating in a 2018 BOA Texas competition income-to-poverty ratio with a scatter plot showed a positive linear association when compared to competition scores revealed a Pearson's correlation coefficient of .459. The regression model was significant ($F(1, 212) = 56.69, p < .000$, with an R^2 of .211, showing that 21.1% of the variance in scores can be explained by variance in income-to-poverty ratio (See Figure 4).

Figure 4

Relationship between scores at the 2018 Bands of America Texas competitions and school income-to-poverty ratio

Research Question #3 Summary

Regression analyses revealed little relationship between free-reduced lunch, and income-to-poverty ratio when compared to the scores at 2018 BOA Regional Championships. Unlike research question two, FRL and IPR showed comparable results with the regression model and a similar R^2 variance. However, the R^2 for the scatter plots highlights there was little variance that can be explained with the scores and the independent variables. Appendix F presents the scatter plots for each of the BOA marching competitions in 2018.

Summary

Research question one showed there was a significant difference between the demographic information of schools that participated at 2018 BOA competitions and all public

schools in the USA. A school that participated in a BOA competition was more likely to have fewer students on free-reduced lunch and have higher income-to-poverty ratio scores compared to the national average. Both variables, free-reduced lunch percentage and income-to-poverty ratios, are indicators of the economic impact for that school community. This current study examined the entire school population and not individual students that participate in the marching bands. Examining publicly available data provides a different view of socioeconomic variables of a specific school community.

Based on the Factorial ANOVA analysis, IPR does not appear to have the same relationship as the variable FRL. However, the variables do appear to have comparable results with the regression model and a similar R^2 variance. Further examination of the two SES variables as a reliable predictor of success in marching band competitions is needed based on the results from this current study.

CHAPTER 5

DISCUSSION AND CONCLUSION

Chapter five includes findings, conclusions, discussion, and recommendations for future research implications. The purpose of this quantitative study was to examine the relationship between selected school demographics and participation and competitive rankings at the 2018 Bands of America (BOA) marching competitions. Specific research questions were:

- 1) What are the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating in BOA competitions across the United States of America?
 - a. What are the differences between the ethnicity demographics, free-reduced lunch percentages, and income-to-poverty ratio of schools participating at BOA competitions and all public schools in the United States of America?
 - b. What are the differences between the ethnicity demographics and free-reduced lunch percentages of Texas schools participating at BOA competitions and all public schools in the State of Texas?
- 2) Is there a difference between finalist and non-finalist schools' free-reduced lunch percentage and income-to-poverty ratio at BOA competitions?
- 3) What is the relationship between free-reduced lunch percentage and income-to-poverty ratio and the scores at BOA Regional Championships competitions?

Participation at BOA Competitions

The variables analyzed in this study provide an interesting characterization of high school marching bands electing to participate in the 2018BOA marching competitions. I examined BOA because of the multiple marching competitions held across the United States. Because data were

collected from one marching band circuit, these data might not be representative of American marching bands overall. Rickels (2009) collected data through surveys from high schools competing at a variety of marching festivals, which provided information of the average marching band in America. This current study expanded the literature by collecting data from one national marching band circuit that uses a standard rubric for all competitions and collected publicly available data to compare marching bands.

Data analyses compared ethnicity demographics of schools participating in BOA marching competitions with national averages. This analysis revealed statistically significant differences. Schools that participated in the 2018 BOA marching competitions had significantly higher percentage of “White” students and lower percentage of “Hispanic” and “Black” students. Examining schools from Texas that participated in BOA competitions showed different results when comparing to the State of Texas ethnicity demographics. A one sample *t*-test indicated a statistically significant difference in participation in ethnicity demographics except for “Hispanic” and “White” student populations.

The relationships between a school’s percentage of students with free-reduced lunch, a school’s IPR, and ethnicity demographics and participation at specific marching competitions merit further research. Previous research examined marching competitions in a State or a specific region of the USA. This study only examined one year of a specific marching band circuit, therefore, expanding to all areas of music competition would provide greater insight about schools that choose to participate. As marching band productions and expectations for competition continue to grow, music educators will need to evaluate the equitable access of marching competitions for all schools. Previous research has indicated that Drum Corp International competition has influenced high school marching band programs (Laib, 1984), as

evidenced by the decisions of band directors choosing similar rehearsal strategies and show design. Further examination regarding cost per-a-competitive-year associated to BOA marching competitions would provide further data about how band fees and the economics of a community might impact participation and competitive results.

Free-Reduced Lunch Percentage vs. Income-to-Poverty Ratio

Free-reduced lunch percentage is one of the most used variables for SES in educational research (Sirin, 2005). Income-to-poverty ratio is a newer measurement from the Department of Education that has not been fully examined as a SES variable. This current study showed mixed results when comparing free-reduced lunch percentage and income-to-poverty ratio. Using the Factorial ANOVA for both free-reduced lunch percentage and income-to-poverty ratio showed a difference in the two variables. Free-reduced lunch percentage showed a statistically significant difference between the finalist and non-finalist marching bands at BOA competitions. However, income-to-poverty ratio did not have a statistically significant difference between the finalist and non-finalist. The scatter plot results showed comparable results in the regression model and R^2 variance. Appendix E shows the independent samples t -test for each of the BOA marching competitions in 2018. Both free-reduced lunch percentage and income-to-poverty ratio had a statistically significant difference between non-finalist and finalist for McAllen Regional Championship and San Antonio Super Regional Championship.

Overall, this study demonstrated that there are mixed results on how comparable free-reduced lunch percentage and income-to-poverty ratio are in educational research. IPR was developed to have a more reliable measure to identify the poverty levels of public schools (Geverdt & Nixon, 2018). The validity of free-reduced lunch percentage has been an issue for using the data as an identifier for poverty. Michelmore and Dynarski (2017) discussed how free-

reduced lunch percentage data can obscure important variation in household resources at both the top and bottom of the income distribution. Hawell and LeBeau (2010) discussed how free-reduced lunch is not a valid indicator of poverty because it does not capture household economic resources. Even with the concerns of validity with free-reduced lunch as an SES variable, it is still used throughout educational research. Income-to-poverty ratio should be examined by researchers about the validity of the measurement for future research.

The Relationship between School Demographic Variables and Results

Stern (2021) found a statistically significant difference in free-reduced lunch percentage of schools that were non-finalist and finalist for the 2017 BOA San Antonio Super Regional Championship. This study expanded Stern's research by examining free-reduced lunch percentage and IPR and the differences between non-finalist and finalists' schools for all BOA competitions in 2018. The factorial ANOVA results for research question two indicated a statistically significant difference between finalist and non-finalist schools and the variables of free-reduced lunch percentage, however income-to-poverty ratio did not have comparable results. This current study was able to replicate Stern's findings for the 2018 competition year.

There were 52 schools that competed both years in the San Antonio Super Regional Championship, indicating that there are a consistent number of schools that participate. Examining multiple years of a single competition would provide a large representation on the correlation between free-reduced lunch and contest scores. Table 15 shows the mean of free-reduced lunch percentage of the subgroups non-finalist and finalist bands between the two years of San Antonio Super Regional competitions. Data from the 2017 San Antonio Super Regional comes from Stern (2021).

Table 13

Free-Reduced Lunch Percentages of Participating Schools at BOA San Antonio Super Regional

Group	<i>n</i>	Range	<i>M</i>	<i>Mdn</i>	<i>SD</i>
Finalist					
2018	14	41.66%	16.67%	22.73%	12.04
2017	14	23.50%	13.77%	10.40%	8.67
Non-Finalist					
2018	69	91.04%	41.47%	30.42%	25.10
2017	54	96.30%	37.03%	31.15%	26.44
All Bands					
2018	83	95.27%	37.29%	29.42%	25.15
2017	68	96.30%	32.24%	25.55%	25.64

Previous research suggests that socioeconomic variables can impact musical achievement and outcomes (Bailey, 2018; Dame, 2010; Schmidt et al., 2006; Speer, 2014). This study indicated a significant relationship between scores and SES variables of a school. However, the variance in the scores showed a weak relationship when examining free-reduced lunch percentage and income-to-poverty ratio. Research question #3 focused on the BOA Regional Championships in 2018. Individual competitions had a wide range of R^2 variance examining free-reduced lunch percentage and income-to-poverty ratio in relation to the bands scores. Table 14 highlights the relationship of free-reduced lunch percentage and income-to-poverty ratio when compared to band scores for each competition.

Table 14

R² of Free-Reduced Lunch and Income to Poverty Ratio Compared to Scores at 2018 Bands of America Marching Competitions

Competition	FRL R^2	IPR R^2

St. George Regional	.178	.293
St. Louis Super Regional	.064	.014

Limitations

One of the limitations of this current study is not knowing the socioeconomic variables of the participating students. However, previous research suggests students who participate in high school music programs typically come from a higher socioeconomic background in comparison with their school's average demographic (Elpus & Abril, 2019). With the likelihood of higher SES students participating in music classes, the percentage of students on free-reduced lunch at a school may not represent the marching band program itself. I examined the school demographics of the entire student population of a school, not the individual students participating in marching band. However, Stern (2021) suggested that the number of students on free-reduced lunch at a

school can still provide a meaningful metric reflecting the number of economic resources available in the community.

Implications and Recommendations for Future Research

Further research is needed concerning the impact of socioeconomic levels on marching band competitions and equitable access to resources. This study could be replicated over several years or expanded to state festivals and other national marching band circuits. The next step in analyzing data is examining the public records of band budgets to determine the actual expenditures marching bands accrue each competitive season. Elpus and Gris  (2019) examined publicly available IRS documents for music booster clubs of schools to estimate the impact on the private financing of public music education at the national and local level. Using contest scores and similar data examined by Elpus and Gris  would be a natural progression of examining relationships between socioeconomic variables of a school and contest results.

A clear understanding of the impact of music funding on contest results can help inform contest organizers of potential inequalities in the opportunities for marching bands to participate at festivals. While this study does not provide an experimental model that could concretely define causal relationships between the examined variable, the results have implications for contest organizers and future research. Organizers of marching competitions should examine rubrics and policies to ensure equity for all marching bands to participate and not let resources be a determining factor. The data gathered in this study could be used by marching band circuits to identify the participation trends of marching bands and help form future policy discussions.

Cost is a key factor when deciding to participate in BOA competitions, and the resources of the community can impact that decision. The cost related to participating in BOA is more than the entry fees, but also includes the cost of copyright fees, additional staff during rehearsals, drill

writers, music arranger, color guard equipment, sound equipment and travel cost (Eubanks, 2016). These costs could vary depending on the show design of the high school and the number BOA competitions that the directors decide to participate in. Further research on the financial impact and budgets of marching bands could provide insight on the state of music education or equity gaps across the United States.

With the impact of COVID-19 on music competitions not yet examined, future research on competitions that took place during the pandemic should be explored. Bands of America did not hold competitions in 2020, some festivals were able to happen based on the policies of individual States. University Interscholastic League (UIL) in Texas held their normal competitive marching band season, however some districts decided that their schools would not participate. Furthermore, it would be important to see how the financial impact of the pandemic affects the 2021 competitive marching band season and examine how it affected participation and results. Examining schools that participated and using variables that were used in this study would provide insight on marching competitions during the COVID-19 pandemic.

Another national marching band circuit, US Bands, offers marching competitions throughout the United States of America. The circuit has several types of championships and had 115 marching band competitions in 2018 compared to the 22 held by BOA. Replicating this current study on the US Bands circuit could provide an understanding on what types of communities choose to participate in the US Bands circuit compared to the BOA circuit. By examining schools that participate in US Bands over BOA competitions, it could provide insight on the impact that resources have on choosing what marching contest to participate in.

Further research examining Texas and the culture of competitive marching band in Texas would provide insight on the impact the culture has had on music education. Schools that

participate in BOA also compete in Texas UIL marching competitions each year. BOA and UIL use different rubrics to evaluate marching band, with the biggest difference being the general effect category for BOA. An analysis of the impact BOA has had on UIL competitions would provide meaningful information for music educators, school administrators and parent organizations.

Access to music education in public schools continue to be the focus of advocacy groups across the USA. Music educators are the advocates within their school districts to ensure music curriculum is available to all students. However, teachers must make sure their own policies are not holding back students from participating based on their economic recourses. Each State and school district have different policies in place that discuss what public schools can charge fees to students for various reasons. For example, in the State of Texas Education Code § 11.158 discusses the authority to charge fees in a school district. One example that a school cannot charge fees to a student is the instructional costs for necessary school personnel employed in any course or educational program required for graduation. In Texas, students are required to take one fine arts credit for their high school diploma. Previous research has discussed how schools hire additional staff for marching band instruction such as marching technicians or color guard instruction (Rickels, 2009). Texas school districts may be breaking Education Code through charging student fees to be in marching band and using the money to pay additional staff. Marching band directors should regularly review district and State policy to ensure they are in compliance. Without self-regulation from music educators, State Legislatures could step in to address equal access to public education courses.

Conclusion

Marching bands have had a long and growing tradition in the United States public schools. The experience of being in a marching band provides meaningful learning experiences for students both musically and socially. Marching band contests provide an opportunity for student ensembles to be evaluated based on the rubric developed by the organizing circuit. This study showed that the ethnicity demographics and SES variables of a school may impact the decision to participate at a BOA marching competition. A relationship exists between a school's free-reduced lunch percentage and the bands' success at a marching band competition. By examining a larger data set from multiple BOA competitions, this study provided a unique view of schools that participate in the circuit and how the SES effects the finals results.

The purpose of this dissertation was to examine the relationships between selected school demographics on participation and competitive rankings at Bands of America marching competitions. The results of this study highlight:

- the relationships between a school's SES demographics and participation in a BOA marching competition.
- the relationships between a school's SES demographics and the overall outcome at a BOA marching competition.

Although there are numerous variables that band directors consider when choosing what marching band competitions to participate in, I hope this dissertation will open a discussion on how the economics of a community can impact the participation of marching competitions. Directors selecting a contest based on available resources in their program is a reality of the profession. Music educators should continue to reflect on what they want the profession to look like in the future. Our profession should welcome all students who want to participate and make

music. However, the systems of competition that we have created may not reflect the core value of welcoming all to participate.

APPENDIX A
INSTITUTIONAL REVIEW BOARD DOCUMENTATION

10/8/2020

Mail - Martin Lenard - Outlook

Lenard AU IRB #20-385 NHSR "Effects of Selected Variables on Participation and Competitive Rankings at Bands of America Marching Competitions"

IRB Administration <irbadmin@auburn.edu>

Thu 10/8/2020 1:55 PM

To: Martin Lenard <mdl0073@auburn.edu>

Cc: Nancy Barry <nhb0002@auburn.edu>; Marilyn Strutchen <strutme@auburn.edu>

Dear Mr. Lenard,

The IRB has reviewed your request for the study titled "Effects of Selected Variables on Participation and Competitive Rankings at Bands of America Marching Competitions". The IRB has determined that your project, as described in the submission, is not considered human subjects research (NHSR).

Further documentation for this study does not need to be submitted. If you make any changes to your study that might include human subjects research, please contact our office. If you need an official letter regarding this decision, please let us know.

Best regards,

IRB Administration
Office of Research Compliance

APPENDIX C

LIST OF 2018 BANDS OF AMERICA COMPETITIONS WITH DATE AND LOCATION

2018 Bands of America Marching Band Competitions

Date	Contest Name	Location
09/22/2018	Oxford Regional Championship	Miami University - Oxford, OH
09/22/2018	McAllen Regional Championship	McAllen Memorial Stadium – McAllen, TX
09/22/2018	Midland Regional Championship	Grande Communication Stadium – Midland, TX
09/29/2018	Austin Regional Championship	Kelly Reeves Athletic Complex – Austin, TX
09/29/2018	Bowling Green Regional Championship	Bowling Green State University – Bowling Green, OH
09/29/2018	Clarksville Regional Championship	Austin Peay State University – Clarksville, TN
10/06/2018	Jacksonville Regional Championship	Jacksonville State University – Jacksonville, AL
10/06/2018	Dallas/Ft. Worth Regional Championship	Pennington Field – Bedford, TX
10/06/2018	Houston Regional Championship	Woodforest Bank Stadium – Houston, TX
10/13/2018	Gaffney Regional Championship	Gaffney High School – Gaffney, SC
10/13/2018	Waco Regional Championship	Waco ISD Stadium – Waco, TX
10/13/2018	Orlando Regional Championship	Camping World Stadium – Orlando, FL
10/13/2018	Canton regional Championship	Tom Benson Hall of Fame Stadium – Canton, OH
10/19-20/2018	Indianapolis Super Regional Championship	Lucas Oil Stadium – Indianapolis, IN
10/20/2018	Mid-Atlantic Regional Championship	Delaware Stadium – Newark, DE
10/20/2018	Northern California Regional Championship	Diablo Valley University – Pleasant Hill, CA
10/26-27/2018	St. Louis Super Regional Championship	The Dome at America’s Center – St. Louis, MO

2018 Bands of America Marching Band Competitions (continued)

Date	Contest Name	Location
10/27/2018	St. George Regional Championship	Dixie State College - St. George, UT
11/2-3/2018	San Antonio Super Regional Championship	Alamodome – San Antonio, TX
11/03/2018	Southern California Regional Championship	Monarch Stadium – Valley Glen, CA
11/08-10/2018	Grand National Championships	Lucas Oil Stadium – Indianapolis, IN
